简介

这是我个人用于复习的「*Linear Algebra Done Right 3E/4E, by Sheldon Axler*」笔记，一本习题选答与课文补注。因为使用中文会给我编撰这份笔记带来额外的中英文输入法切换的工作成本，况且对于专业学习者，直接使用英文不会造成任何困扰。但英文词句的冗长性拖慢我复习的效率，所以我对许多常用术语作了简写。这份笔记的内容范围和标识说明，我已经在[自述](#)中写得很清楚，不再赘述。这份笔记尚处于缓慢的编撰进度中。

1 Prove that $\forall v \in V, -(-v) = v$.

SOLUTION:

$$\left. \begin{array}{l} -(-v) + (-v) = 0 \\ v + (-v) = 0 \end{array} \right\} \Rightarrow \text{By the uniqueness of add inv, we are done.}$$

$$\text{OR. } -(-v) = (-1)((-1)v) = ((-1)(-1))v = 1 \cdot v = v. \quad \square$$

2 Suppose $a \in \mathbf{F}, v \in V$, and $av = 0$. Prove that $a = 0$ or $v = 0$.

SOLUTION:

$$\text{Suppose } a \neq 0, \exists a^{-1} \in \mathbf{F}, a^{-1}a = 1, \text{ hence } v = 1 \cdot v = (a^{-1}a)v = a^{-1}(av) = a^{-1} \cdot 0 = 0. \quad \square$$

3 Suppose $v, w \in V$. Explain why $\exists! x \in V, v + 3x = w$.

SOLUTION:

$$[\text{Existence}] \text{ Let } x = \frac{1}{3}(w - v).$$

$$[\text{Uniqueness}] \text{ Suppose } v + 3x_1 = w, \text{ (I) } v + 3x_2 = w \text{ (II). Then (I) - (II) : } 3(x_1 - x_2) = 0 \Rightarrow x_1 = x_2. \quad \square$$

$$\text{OR. } v + 3x = w \Leftrightarrow 3x = w - v \Leftrightarrow x = \frac{1}{3}(w - v). \quad \square$$

5 Show that in the def of a vecsp, the add inv condition can be replaced by [1.29].

Hint: Suppose V satisfies all conds in the def, except we've replaced the add inv cond with [1.29].

Prove that the add inv is true.

$$\text{Using [1.31]. } 0v = 0 \text{ for all } v \in V \Leftrightarrow (1 + (-1))v = 1 \cdot v + (-1)v = v + (-v) = 0. \quad \square$$

6 Let ∞ and $-\infty$ denote two distinct objects, neither of which is in \mathbf{R} .

Define an add and scalar multi on $\mathbf{R} \cup \{\infty, -\infty\}$ as you could guess.

The operations of real numbers is as usual. While for $t \in \mathbf{R}$ define

$$t\infty = \begin{cases} -\infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t > 0, \end{cases} \quad t(-\infty) = \begin{cases} -\infty & \text{if } t > 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t < 0, \end{cases}$$

$$\text{(I) } t + \infty = \infty + t = \infty + \infty = \infty,$$

$$\text{(II) } t + (-\infty) = (-\infty) + t = (-\infty) + (-\infty) = -\infty,$$

$$\text{(III) } \infty + (-\infty) = (-\infty) + \infty = 0.$$

With these operations of add and scalar multi, is $\mathbf{R} \cup \{\infty, -\infty\}$ a vecsp over \mathbf{R} ? Explain.

SOLUTION:

Not a vecsp, since the add and scalar mult is not assoc and distr.

By Assoc: $(a + \infty) + (-\infty) \neq a + (\infty + (-\infty))$.

OR. By Distr: $\infty = (2 + (-1))\infty \neq 2\infty + (-\infty) = \infty + (-\infty) = 0. \quad \square$

• TIPS: About the Field \mathbf{F} : Many choices.

EXAMPLE: $\mathbf{F} = \mathbf{Z}_m = \{K_0, K_1, \dots, K_{m-1}\}, \forall m - 1 \in \mathbf{N}^+.$ (See Euler's Theorem.)

7 Give a nonempty $U \subseteq \mathbb{R}^2$,

U is closed under taking add invs and under add, but is not a subsp of \mathbb{R}^2 .

SOLUTION: ($0 \in U$; $v \in U \Rightarrow -v \in U$. And operations on U are the same as \mathbb{R}^2 .) Let $\mathbb{Z}^2, \mathbb{Q}^2$.

8 Give a nonempty $U \subseteq \mathbb{R}^2$, U is closed under scalar multi, but is not a subsp of \mathbb{R}^2 .

SOLUTION: Let $U = \{(x, y) \in \mathbb{R}^2 : x = 0 \vee y = 0\}$.

9 A function $f : \mathbb{R} \rightarrow \mathbb{R}$ is called periodic if $\exists p \in \mathbb{N}^+$, $f(x) = f(x + p)$ for all $x \in \mathbb{R}$.
Is the set of periodic functions $\mathbb{R} \rightarrow \mathbb{R}$ a subsp of $\mathbb{R}^{\mathbb{R}}$? Explain.

SOLUTION: Denote the set by S .

Suppose $h(x) = \cos x + \sin \sqrt{2}x \in S$, since $\cos x, \sin \sqrt{2}x \in S$.

Assume $\exists p \in \mathbb{N}^+$ such that $h(x) = h(x + p)$, $\forall x \in \mathbb{R}$. Let $x = 0 \Rightarrow h(0) = h(\pm p) = 1$.

Thus $1 = \cos p + \sin \sqrt{2}p = \cos p - \sin \sqrt{2}p$

$\Rightarrow \sin \sqrt{2}p = 0$, $\cos p = 1 \Rightarrow p = 2k\pi, k \in \mathbb{Z}$, while $p = \frac{m\pi}{\sqrt{2}}, m \in \mathbb{Z}$.

Hence $2k = \frac{m}{\sqrt{2}} \Rightarrow \sqrt{2} = \frac{m}{2k} \in \mathbb{Q}$. Contradiction! □

OR. Because [I] : $\cos x + \sin \sqrt{2}x = \cos(x + p) + \sin(\sqrt{2}x + \sqrt{2}p)$. By differentiating twice,

[II] : $\cos x + 2 \sin \sqrt{2}x = \cos(x + p) + 2 \sin(\sqrt{2}x + \sqrt{2}p)$.

$\left. \begin{array}{l} \text{[II]} - \text{[I]} : \sin \sqrt{2}x = \sin(\sqrt{2}x + \sqrt{2}p) \\ 2\text{[I]} - \text{[II]} : \cos x = \cos(x + p) \end{array} \right\} \Rightarrow \text{Let } x = 0, p = \frac{m\pi}{\sqrt{2}} = 2k\pi. \text{ Contradicts.}$ □

• Suppose U, W, V_1, V_2, V_3 are subsp of V .

15 $U + U \ni u + w \in U$. □

16 $U + W \ni u + w = w + u \in W + U$. □

17 $(V_1 + V_2) + V_3 \ni (v_1 + v_2) + v_3 = v_1 + (v_2 + v_3) \in V_1 + (V_2 + V_3)$. □

18 Does the add on the subsp of V have an add identity? Which subsp have add invs?

SOLUTION: Suppose Ω is the unique add identity.

(a) For any subsp U of V . $\Omega \subseteq U + \Omega = U \Rightarrow \Omega \subseteq U$. Let $U = \{0\}$, then $\Omega = \{0\}$.

(b) Now suppose W is an add inv of $U \Rightarrow U + W = \Omega$.

Note that $U + W \supseteq U, W \Rightarrow \Omega \supseteq U, W$. Thus $U = W = \Omega = \{0\}$. □

11 Prove that the intersection of every collection of subsp of V is a subsp of V .

SOLUTION: Suppose $\{U_\alpha\}_{\alpha \in \Gamma}$ is a collection of subsp of V ; here Γ is an arbitrary index set.

We show that $\bigcap_{\alpha \in \Gamma} U_\alpha$, which equals the set of vecs that are in U_α for each $\alpha \in \Gamma$, is a subsp of V .

(一) $0 \in \bigcap_{\alpha \in \Gamma} U_\alpha$. Nonempty.

(二) $u, v \in \bigcap_{\alpha \in \Gamma} U_\alpha \Rightarrow u + v \in U_\alpha, \forall \alpha \in \Gamma \Rightarrow u + v \in \bigcap_{\alpha \in \Gamma} U_\alpha$. Closed under add.

(三) $u \in \bigcap_{\alpha \in \Gamma} U_\alpha, \lambda \in \mathbb{F} \Rightarrow \lambda u \in U_\alpha, \forall \alpha \in \Gamma \Rightarrow \lambda u \in \bigcap_{\alpha \in \Gamma} U_\alpha$. Closed under scalar multi.

Thus $\bigcap_{\alpha \in \Gamma} U_\alpha$ is nonempty subset of V that is closed under add and scalar multi. □

12 Suppose U, W are subsp of V . Prove that $U \cup W$ is a subsp of $V \iff U \subseteq W$ or $W \subseteq U$.

SOLUTION:

(a) Suppose $U \subseteq W$. Then $U \cup W = W$ is a subsp of V .

(b) Suppose $U \cup W$ is a subsp of V . Suppose $U \not\subseteq W$ and $U \not\supseteq W$ ($U \cup W \neq U$ and W).

Then $\forall a \in U \wedge a \notin W, b \in W \wedge b \notin U, a + b \in U \cup W$.

$\left. \begin{array}{l} \text{If } a + b \in U \Rightarrow b = (a + b) + (-a) \in U, \text{ contradicts!} \\ \text{If } a + b \in W \Rightarrow a = (a + b) + (-b) \in W, \text{ contradicts!} \end{array} \right\} \Rightarrow U \cup W = U \text{ or } W. \text{ Contradicts!}$

Thus $U \subseteq W$ and $U \supseteq W$. □

13 Prove that the union of three subsp of V is a subsp of V if and only if one of the subsp contains the other two.

This exercise is not true if we replace \mathbf{F} with a field containing only two elements.

SOLUTION:

Suppose U_1, U_2, U_3 are subsp of V . Denote $U_1 \cup U_2 \cup U_3$ by \mathcal{U} .

(a) Suppose that one of the subsp contains the other two.

Then $\mathcal{U} = U_1, U_2$ or U_3 is a subsp of V .

(b) Suppose that $U_1 \cup U_2 \cup U_3$ is a subsp of V .

Distinctively notice that $A \cup B \cup C = (A \cup B) \cup (B \cup C) = (A \cup C) \cup (B \cup C) = (A \cup B) \cup (A \cup C)$.

Also note that, if $U \cup W = V$ is a vecsp, then in general U and W are not subsp of V .

Hence this literal trick is invalid.

(I) If any U_j is contained in the union of the other two, say $U_1 \subseteq U_2 \cup U_3$, then $\mathcal{U} = U_2 \cup U_3$.

By applying Problem (12) we conclude that one U_j contains the other two. Thus we are done.

(II) Assume that no U_j is contained in the union of the other two,

and no U_j contains the union of the other two.

Say $U_1 \not\subseteq U_2 \cup U_3$ and $U_1 \not\supseteq U_2 \cup U_3$.

$\exists u \in U_1 \wedge u \notin U_2 \cup U_3; v \in U_2 \cup U_3 \wedge v \notin U_1$. Let $W = \{v + \lambda u : \lambda \in \mathbf{F}\} \subseteq \mathcal{U}$.

Note that $W \cap U_1 = \emptyset$, for if any $v + \lambda u \in W \cap U_1$ then $v + \lambda u - \lambda u = v \in U_1$.

Now $W \subseteq U_1 \cup U_2 \cup U_3 \Rightarrow W \subseteq U_2 \cup U_3$. $\forall v + \lambda u \in W, v + \lambda u \in U_i, i = 2, 3$.

If $U_2 \subseteq U_3$ or $U_2 \supseteq U_3$, then $\mathcal{U} = U_1 \cup U_i, i = 2, 3$. By Problem (12) we are done.

Otherwise, both $U_2, U_3 \neq \{0\}$. Because $W \subseteq U_2 \cup U_3$ has at least three elements.

There must be some U_i that contains at least two elements of W .

\exists distinct $\lambda_1, \lambda_2 \in \mathbf{F}, v + \lambda_1 u, v + \lambda_2 u \in U_i, i \in \{2, 3\}$.

Then $u \in U_i$ while $u \notin U_2 \cup U_3$. Contradicts. □

EXAMPLE: Let $\mathbf{F} = \mathbf{Z}_2$. $U_1 = \{u, 0\}, U_2 = \{v, 0\}, U_3 = \{v + u, 0\}$. While $\mathcal{U} = \{0, u, v, v + u\}$ is a subsp.

• **EXAMPLE:** Suppose $U = \{(x, x, y, y) \in \mathbf{F}^4\}, W = \{(x, x, x, y) \in \mathbf{F}^4\}$.

Prove that $U + W = \{(x, x, y, z) \in \mathbf{F}^4\}$.

Let T denote $\{(x, x, y, z) \in \mathbf{F}^4 : x, y, z \in \mathbf{F}\}$. By def, $U + W \subseteq T$.

And $T \ni (x, x, y, z) \Rightarrow (0, 0, y - x, y - x) + (x, x, x, -y + x + z) \in U + W$. Hence $T \subseteq U + W$. □

21 Suppose $U = \{(x, y, x + y, x - y, 2x) \in \mathbf{F}^5\}$. Find a W such that $\mathbf{F}^5 = U \oplus W$.

SOLUTION: Let $W = \{(0, 0, z, w, u) \in \mathbf{F}^5\}$. Then $U \cap W = \{0\}$.

And $\mathbf{F}^5 \ni (x, y, z, w, u) \Rightarrow (x, y, x + y, x - y, 2x) + (0, 0, z - x - y, w - x - y, u - 2x) \in U + W$.

23 Give an example of vecsps V_1, V_2, U such that $V_1 \oplus U = V_2 \oplus U$, but $V_1 \neq V_2$.

SOLUTION: $V = \mathbf{F}^2$, $U = \{(x, x) \in \mathbf{F}^2\}$, $V_1 = \{(x, 0) \in \mathbf{F}^2\}$, $V_2 = \{(0, x) \in \mathbf{F}^2\}$.

• **TIPS:** Suppose $V_1 \subseteq V_2$ in Exercise (23). Prove or give a counterexample: $V_1 = V_2$.

SOLUTION:

Because the subset V_1 of vecsp V_2 is closed under add and scalar multi, V_1 is a subspace of V_2 .

Suppose W is such that $V_2 = V_1 \oplus W$. Now $V_2 \oplus U = (V_1 \oplus W) \oplus U = (V_1 \oplus U) \oplus W = V_1 \oplus U$.

If $W \neq \{0\}$, then $V_1 \oplus U \subsetneq (V_1 \oplus U) \oplus W$, contradicts. Hence $W = \{0\}$, $V_1 = V_2$. \square

• Suppose V_1, V_2, U_1, U_2 are vecsps, $V_1 \oplus U_1 = V_2 \oplus U_2$, $V_1 \subseteq V_2$, $U_2 \subseteq U_1$.

Prove or give a counterexample: $V_1 = V_2$, $U_1 = U_2$.

V_1	U_1
V_2	U_2

SOLUTION: A counterexample: [Using notations in Chapter 2.]

Let $V = \mathbf{F}^3$, $B_V = (e_1, e_2, e_3)$, $V_1 = \text{span}(e_1)$, $U_1 = \text{span}(e_2, e_3)$, $V_2 = \text{span}(e_1, e_2)$, $U_2 = \text{span}(e_3)$.

Now $V_1 \subseteq V_2$, $U_2 \subseteq U_1$ and $V_1 \oplus U_1 = V_2 \oplus U_2$. But $V_1 \neq V_2$, $U_1 \neq U_2$. \square

24 Let $V_E = \{f \in \mathbf{R}^{\mathbf{R}} : f \text{ is even}\}$, $V_O = \{f \in \mathbf{R}^{\mathbf{R}} : f \text{ is odd}\}$. Show that $V_E \oplus V_O = \mathbf{R}^{\mathbf{R}}$.

SOLUTION: (a) $V_E \cap V_O = \{f \in \mathbf{R}^{\mathbf{R}} : f(x) = f(-x) = -f(-x)\} = \{0\}$.

$$(b) \left\{ \begin{array}{l} \text{Let } f_e(x) = \frac{1}{2}[g(x) + g(-x)] \Rightarrow f_e \in V_E \\ \text{Let } f_o(x) = \frac{1}{2}[g(x) - g(-x)] \Rightarrow f_o \in V_O \end{array} \right\} \Rightarrow \forall g \in \mathbf{R}^{\mathbf{R}}, g(x) = f_e(x) + f_o(x). \quad \square$$

Then $a_k = b_k + \dots + b_m$; $a_{k+1} = b_{k+1} + \dots + b_m \Rightarrow b_k = a_k - a_{k+1}$; $b_m = a_m$. Similar to Problem (1).

(b) $P \Rightarrow Q$: $b_1 w_1 + \dots + b_m w_m = 0 = a_1 v_1 + \dots + a_m v_m$, where $0 = a_k = b_k + \dots + b_m$.

SOLUTION:

$P \Rightarrow Q$: Suppose V is infinite-dim, so that no list spans V .

Step 1 Pick a $v_1 \neq 0$, (v_1) linely inde.

Step m Pick a $v_m \notin \text{span}(v_1, \dots, v_{m-1})$, by Problem (11), (v_1, \dots, v_m) is linely inde.

This process recursively defines the desired sequence (v_1, v_2, \dots) .

$\neg P \Rightarrow \neg Q$: Suppose V is finite-dim and $V = \text{span}(w_1, \dots, w_m)$.

Let (v_1, v_2, \dots) be a sequence in V , then $(v_1, v_2, \dots, v_{m+1})$ must be linely dep.

OR. $Q \Rightarrow P$: Suppose there is such a sequence.

Choose an m . Suppose a linely inde list (v_1, \dots, v_m) spans V .

16 Prove that the vecsp of all continuous functions in $\mathbb{R}^{[0,1]}$ is infinite-dim.

SOLUTION: Denote the vecsp by U .

Choose one $m \in \mathbb{N}^+$. Suppose $a_0, \dots, a_m \in \mathbb{R}$ are such that $p(x) = a_0 + a_1x + \dots + a_mx^m = 0, \forall x \in [0, 1]$.

Then p has infinitely many roots and hence each $a_k = 0$, otherwise $\deg p \geq 0$, contradicts [4.12].

Thus $(1, x, \dots, x^m)$ is linely inde in $\mathbb{R}^{[0,1]}$. Similar to [2.16], U is infinite-dim. \square

OR. Note that $\frac{1}{1} > \frac{1}{2} > \dots > \frac{1}{m}, \forall m \in \mathbb{N}^+$. Suppose $f_m = \begin{cases} x - \frac{1}{m}, & x \in \left(\frac{1}{m}, 1\right] \\ 0, & x \in \left[0, \frac{1}{m}\right] \end{cases}$

Then $f_1\left(\frac{1}{m}\right) = \dots = f_m\left(\frac{1}{m}\right) = 0 \neq f_{m+1}\left(\frac{1}{m}\right)$. Hence $f_{m+1} \notin \text{span}(f_1, \dots, f_m)$. By Problem (14). \square

17 Suppose $p_0, p_1, \dots, p_m \in \mathcal{P}_m(\mathbb{F})$ such that $p_k(2) = 0$ for each $k \in \{0, \dots, m\}$.

Prove that (p_0, p_1, \dots, p_m) is not linely inde in $\mathcal{P}_m(\mathbb{F})$.

SOLUTION:

Suppose (p_0, p_1, \dots, p_m) is linely inde. Define $p \in \mathcal{P}_m(\mathbb{F})$ by $p(z) = z$.

NOTICE that $\forall a_i \in \mathbb{F}, z \neq a_0p_0(z) + \dots + a_mp_m(z)$, for if not, let $z = 2$. Thus $z \notin \text{span}(p_0, p_1, \dots, p_m)$.

Then $\text{span}(p_0, p_1, \dots, p_m) \subsetneq \mathcal{P}_m(\mathbb{F})$ while the list (p_0, p_1, \dots, p_m) has length $(m+1)$.

Hence (p_0, p_1, \dots, p_m) is linely depe in $\mathcal{P}_m(\mathbb{F})$.

For if not, then because $(1, z, \dots, z^m)$ of length $(m+1)$ spans $\mathcal{P}_m(\mathbb{F})$,

by the steps in [2.23] trivially, (p_0, p_1, \dots, p_m) of length $(m+1)$ spans $\mathcal{P}_m(\mathbb{F})$. Contradicts. \square

OR. Note that $\mathcal{P}_m(\mathbb{F}) = \text{span}\left(\underbrace{1, z, \dots, z^m}_{\text{of length } (m+1)}\right)$. Then $(p_0, p_1, \dots, p_m, z)$ of length $(m+2)$ is linely dep.

As shown above, $z \notin \text{span}(p_0, p_1, \dots, p_m)$. And hence by [2.21](a), (p_0, p_1, \dots, p_m) is linely dep. \square

Let $v_1 = e_1, v_2 = e_2, v_3 = e_3 + e_4, v_4 = e_4$. Then (v_1, \dots, v_4) is a basis of \mathbb{R}^4 .

Let $U = \text{span}(e_1, e_2, e_3) = \text{span}(v_1, v_2, v_3 - v_4)$. Then $v_3 \notin U$ and (v_1, v_2) is not a basis of U . \square

1 Find all vecsps on whatever \mathbf{F} that have exactly one basis.

SOLUTION:

The trivial vecsp $\{0\}$ will do. Indeed, the only basis of $\{0\}$ is the empty list $()$.

Now consider a field containing only the add identity 0 and the multi identity 1,

and let $1 + 1 = 0$. Hence the vecsp $\{0, 1\}$ will do, the list (1) is the unique basis. So is \mathbb{Z}_2 .

And more generally, consider $\mathbf{F} = \mathbb{Z}_m, \forall m - 1 \in \mathbb{N}^+$. For each $s, t \in \{1, \dots, m\}$,

$\mathbf{F} = \text{span}(K_s) = \text{span}(K_t)$. We get more than one basis. So are $\mathbb{Q}, \mathbb{R}, \mathbb{C}$ and all vecsps on such \mathbf{F} .

Consider other \mathbf{F} . Note that this \mathbf{F} contains at least and strictly more than 0 and 1. We fail. \square

- **NOTE FOR *linely inde sequence* and [2.34]:** “ $V = \text{span}(v_1, \dots, v_n, \dots)$ ” is an invalid expression. If we allow using “infinite list”, then we must guarantee that (v_1, \dots, v_n, \dots) is a spanning “list” such that $\forall v \in V, \exists$ smallest $n \in \mathbb{N}^+, v = a_1 v_1 + \dots + a_n v_n$. Moreover, given a list (w_1, \dots, w_n, \dots) in W , we can prove that $\exists ! T \in \mathcal{L}(V, W)$ with each $Tv_k = w_k$, which has less restrictions than [3.5]. - **NEW THEOREM:** Suppose V is finite-dim with $\dim V = n$ and U is a subsp of V with $U \neq V$.

Prove that $\exists B_V = (v_1, \dots, v_n)$ such that each $v_k \notin U$.

Note that $U \neq V \Rightarrow n \geq 1$. We will construct B_V via the following process.

Step 1. $\exists v_1 \in V \setminus U \Rightarrow v_1 \neq 0$. If $\text{span}(v_1) = V$ then we stop.

Step k. Suppose (v_1, \dots, v_{k-1}) is linely inde in V , each of which belongs to $V \setminus U$.

Note that $\text{span}(v_1, \dots, v_{k-1}) \neq V$. And if $\text{span}(v_1, \dots, v_{k-1}) \cup U = V$, then by (1.C.12),

(because $\text{span}(v_1, \dots, v_{k-1}) \not\subseteq U,) U \subseteq \text{span}(v_1, \dots, v_{k-1}) \Rightarrow \text{span}(v_1, \dots, v_{k-1}) = V$.

Hence because $\text{span}(v_1, \dots, v_{k-1}) \neq V$, it must be case that $\text{span}(v_1, \dots, v_{k-1}) \cup U \neq V$.

Thus $\exists v_k \in V \setminus U$ such that $v_k \notin \text{span}(v_1, \dots, v_{k-1})$.

By (2.A.11), (v_1, \dots, v_k) is linely inde in V . If $\text{span}(v_1, \dots, v_k) = V$, then we stop.

Because V is finite-dim, this process will stop after n steps. \square

(c) Find a subsp W of $\mathcal{P}_4(\mathbf{F})$ such that $\mathcal{P}_4(\mathbf{F}) = U \oplus W$.

SOLUTION: Using Problem (10).

NOTICE that $\nexists p \in \mathcal{P}(\mathbf{F})$ of deg 1 and 2, while $p \in U$. Thus $\dim U \leq \dim \mathcal{P}_4(\mathbf{F}) - 2 = 3$.

Note that $v_i - v_1 = (v_i + w) - (v_1 + w) \in \text{span}(v_1 + w, \dots, v_m + w)$, for each $i = 1, \dots, m$.

10 Suppose $m \in \mathbf{N}^+$, $p_0, p_1, \dots, p_m \in \mathcal{P}(\mathbf{F})$ are such that each p_k has degree k .

Prove that (p_0, p_1, \dots, p_m) is a basis of $\mathcal{P}_m(\mathbf{F})$.

SOLUTION: Using mathematical induction on m .

(i) $k = 0, 1$. $\deg p_0 = 0$; $\deg p_1 = 1 \Rightarrow \text{span}(p_0, p_1) = \text{span}(1, x)$.

(ii) $k \in \{1, \dots, m-1\}$. Assume that $\text{span}(p_0, p_1, \dots, p_k) = \text{span}(1, x, \dots, x^k)$.

Then $\text{span}(p_0, p_1, \dots, p_k, p_{k+1}) \subseteq \text{span}(1, x, \dots, x^k, x^{k+1})$.

又 $\deg p_{k+1} = k+1$, $p_{k+1}(x) = a_{k+1}x^{k+1} + r_{k+1}(x)$; $a_{k+1} \neq 0$, $\deg r_{k+1} \leq k$.

$$\Rightarrow x^{k+1} = \frac{1}{a_{k+1}}(p_{k+1}(x) - r_{k+1}(x)) \in \text{span}(1, x, \dots, x^k, p_{k+1}) = \text{span}(p_0, p_1, \dots, p_k, p_{k+1}).$$

$$\therefore x^{k+1} \in \text{span}(p_0, p_1, \dots, p_k, p_{k+1}) \Rightarrow \text{span}(1, x, \dots, x^k, x^{k+1}) \subseteq \text{span}(p_0, p_1, \dots, p_k, p_{k+1}).$$

Thus $\mathcal{P}_m(\mathbf{F}) = \text{span}(1, x, \dots, x^m) = \text{span}(p_0, p_1, \dots, p_m)$. □

We show that $a_m = \dots = a_0 = 0$ via the following process. So that (p_0, p_1, \dots, p_m) is linely inde.

Step 1. For $k = m$, $\xi_m(L) = a_m \xi_m(p_m) = \xi_m(R) = 0$ 又 $\deg p_m = m$, $\xi_m(p_m) \neq 0 \Rightarrow a_m = 0$.

SOLUTION: Using mathematical induction on m .

Let each p_k be defined by $p_k(x) = a_{k,k}x^k + \dots + a_{m,k}x^m$, where $a_{k,k} \neq 0$.

(i) $k = 0, 1$. $p_m(x) = a_{m,m}x^m$; $p_{m-1}(x) = a_{m-1,m-1}x^{m-1} + a_{m,m-1}x^m \Rightarrow \text{span}(x^m, x^{m-1}) = \text{span}(p_m, p_{m-1})$.

(ii) $k \in \{1, \dots, m-1\}$. Assume that $\text{span}(x^m, \dots, x^{m-k}) = \text{span}(p_m, \dots, p_{m-k})$.

Then $\text{span}(p_m, \dots, p_{m-(k+1)}) \subseteq \text{span}(x^m, \dots, x^{m-(k+1)})$.

又 $p_{m-(k+1)}$ has the form $a_{m-(k+1),m-(k+1)}x^{m-(k+1)} + r_{m-(k+1)}(x)$;

where the lowest term of $r_{m-(k+1)} \in \mathcal{P}_m(\mathbf{F})$ is of $\deg(m-k)$.

$$\Rightarrow x^{m-(k+1)} = \frac{1}{a_{m-(k+1),m-(k+1)}}(p_{m-(k+1)}(x) - r_{m-(k+1)}(x)) \in \text{span}(x^m, \dots, x^{m-k}, p_{m-(k+1)})$$

$$= \text{span}(p_m, \dots, p_{m-k}, p_{m-(k+1)}).$$

$$\therefore x^{m-(k+1)} \in \text{span}(p_m, \dots, p_{m-k}, p_{m-(k+1)})$$

$$\Rightarrow \text{span}(x^m, \dots, x^{m-k}, x^{m-(k+1)}) \subseteq \text{span}(p_m, \dots, p_{m-k}, p_{m-(k+1)}).$$

Thus $\mathcal{P}_m(\mathbf{F}) = \text{span}(x^m, \dots, x, 1) = \text{span}(p_m, \dots, p_1, p_0)$. □

OR. 用比较系数法. Denote the coefficient of x^k in $p \in \mathcal{P}(\mathbf{F})$ by $\xi_k(p)$.

Suppose $L = a_m p_m(x) + \dots + a_1 p_1(x) + a_0 p_0(x) = 0 \cdot x^m + \dots + 0 \cdot x + 0 \cdot 1 = R, \forall x \in \mathbf{F}$.

We show that $a_m = \dots = a_0 = 0$ via the following process. So that (p_0, p_1, \dots, p_m) is linely inde.

Step 1. For $k = 0$, $\xi_0(L) = a_0 \xi_0(p_0) = \xi_0(R) = 0$ 又 $\deg p_0 = 0$, $\xi_0(p_0) \neq 0 \Rightarrow a_0 = 0$.

Now $L = a_1 p_1(x) + \dots + a_m p_m(x)$.

Step k. For $0 \leq k \leq m$, we have $a_{k-1} = \dots = a_0 = 0$.

Now $\xi_k(L) = a_k \xi_k(p_k) = \xi_k(R) = 0$ 又 $\deg p_k = k$, $\xi_k(p_k) \neq 0 \Rightarrow a_k = 0$.

Now if $k = m$, then we are done. Otherwise, we have $L = a_{k+1} p_{k+1}(x) + \dots + a_m p_m(x)$. □

• **NOTE FOR [2.11]:** *Good definition for a general term always avoids undefined behaviours.*

If $\deg p = 0$, then $p(z) = a_0 \neq 0$, but not literally $a_0 z^0$, by which if p is defined, then it comes to 0^0 .

To make it clear, we specify that in $\mathcal{P}(\mathbb{F})$, $a_0 z^0 = a_0$, where z^0 appears just for notational convenience.

Because by definition, the term $a_0 z^0$ in a poly only represents the const term of the poly, which is a_0 .

So z^0 doesn't make sense at all.

• (4E 2.C.10) Suppose m is a positive integer. For $0 \leq k \leq m$, let $p_k(x) = x^k(1-x)^{m-k}$.

Show that (p_0, \dots, p_m) is a basis of $\mathcal{P}_m(\mathbb{F})$.

SOLUTION: $\left(\begin{array}{l} \text{We may see that } 0 \text{ is not a zero of } p_0, \text{ and that } p_m(x) = x^m, \\ \text{by the expansion below, and by the NOTE FOR [2.11] above.} \end{array} \right)$

Note that each $p_k(x) = \sum_{j=0}^{m-k} C_{m-k}^j (-1)^j \cdot x^{j+k} \cdot 1^j = \underbrace{(-1)^0 \cdot x^k \cdot 1^0}_{\text{of deg } k} + \underbrace{\sum_{j=1}^{m-k} C_{m-k}^j (-1)^j \cdot x^{j+k} \cdot 1^j}_{\text{of deg } m; \text{ denote it by } q_k(x)}$.

And, each $q_k \in \text{span}(x^{k+1}, \dots, x^m)$. Using TIPS above. \square

OR. Similar to the TIPS above. We will recursively prove that each $x^{m-k} \in \text{span}(p_m, \dots, p_{m-k})$.

(i) $k = 0, 1$. $p_m(x) = x^m$; $p_{m-1}(x) = x^{m-1} - x^m \Rightarrow x^{m-1}$. Now $x^m \in \text{span}(p_m)$, $x^{m-1} \in \text{span}(p_{m-1}, p_m)$.

(ii) $k \in \{1, \dots, m-1\}$. Suppose for each $k \in \{0, \dots, k\}$, we have $x^{m-k} \in \text{span}(p_{m-k}, \dots, p_m)$, $\exists ! a_m \in \mathbb{F}$.

Note that $x^{m-(k+1)} = p_{m-(k+1)}(x) + \sum_{j=1}^{k+1} C_{k+1}^j (-1)^{j+1} x^{m-(k+1)+j} \in \text{span}(p_{m-(k+1)}, x^{m-k}, \dots, x^m)$.

Thus $x^{m-(k+1)} \in \text{span}(p_{m-(k+1)}, p_{m-k}, \dots, p_m)$. \square

COMMENT: The base step and the inductive step can be independent.

OR. For any $m, k \in \mathbb{N}^+$ such that $k \leq m$. Define $p_{k,m}$ by $p_{k,m}(x) = x^k(1-x)^{m-k}$.

Define the statement $S(m)$ by $S(m) : (p_{0,m}, \dots, p_{m,m})$ is linely inde (and therefore is a basis).

We use induction on to show that $S(m)$ holds for all $m \in \mathbb{N}^+$.

(i) $m = 1$. Let $a_0(1-x) + a_1x = 0, \forall x \in \mathbb{F}$. Then take $x = 1, x = 0 \Rightarrow a_1 = a_0 = 0$.

$m = 2$. Let $a_0(1-x)^2 + a_1(1-x)x + a_2x^2, \forall x \in \mathbb{F}$. Then $\begin{cases} x = 0 \Rightarrow a_0 + a_1 = 0; \\ x = 1 \Rightarrow a_2 = 0; \\ x = 2 \Rightarrow a_0 + 2a_1 = 0. \end{cases}$

(ii) $2 \leq m$. Assume that $S(m)$ holds.

Suppose $\sum_{k=0}^{m+2} a_k p_{k,m+2}(x) = \sum_{k=0}^{m+2} a_k [x^k(1-x)^{m+2-k}] = 0, \forall x \in \mathbb{F}$.

Now $a_0(1-x)^{m+2} + \sum_{k=1}^{m+1} a_k x^k(1-x)^{m+2-k} + a_{m+2}x^{m+2} = 0, \forall x \in \mathbb{F}$.

While $x = 0 \Rightarrow a_0 = 0$; $x = 1 \Rightarrow a_{m+2} = 0$. Then $\sum_{k=1}^{m+1} a_k x^k(1-x)^{m+2-k} = 0$;

And note that $\sum_{k=1}^{m+1} a_k x^k(1-x)^{m+2-k}$

$$= x(1-x) \sum_{k=1}^{m+1} a_k x^{k-1}(1-x)^{m+1-k}$$

$$= x(1-x) \sum_{k=0}^m a_{k+1} x^k(1-x)^{m-k} = x(1-x) \sum_{k=0}^m a_{k+1} p_{k,m}(x).$$

Hence $x(1-x) \sum_{k=0}^m a_{k+1} p_{k,m}(x) = 0, \forall x \in \mathbb{F} \Rightarrow \sum_{k=0}^m a_{k+1} p_{k,m}(x) = 0, \forall x \in \mathbb{F} \setminus \{0, 1\}$.

Because $\sum_{k=0}^m a_{k+1} p_{k,m}(x)$ has infinitely many zeros. We have $\sum_{k=0}^m a_{k+1} p_{k,m}(x) = 0, \forall x \in \mathbb{F}$.

By assumption, $a_1 = \dots = a_m = a_{m+1} = 0$, while $a_0 = a_{m+2} = 0$,

Thus $(p_{0,m+2}, \dots, p_{m+2,m+2})$ is linely inde and $S(m+2)$ holds.

Since $\forall m \in \mathbb{N}^+, S(m) \Rightarrow S(m+2)$. We have $\left\{ \begin{array}{l} \forall k \in \mathbb{N}, S(2k+1) \text{ holds} \\ \forall k \in \mathbb{N}^+, S(2k) \text{ holds} \end{array} \right\} \Rightarrow S(m) \text{ holds.}$ \square

14 Suppose that V_1, \dots, V_m are finite-dim subsp of V .

Prove that $V_1 + \dots + V_m$ is finite-dim and $\dim(V_1 + \dots + V_m) \leq \dim V_1 + \dots + \dim V_m$.

SOLUTION:

Choose a basis \mathcal{E}_i of $V_i \Rightarrow V_1 + \dots + V_m = \text{span}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m)$; $\dim V_i = \text{card } \mathcal{E}_i$.

Then $\dim(V_1 + \dots + V_m) = \dim \text{span}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m)$.

$\text{dim span}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m) \leq \text{card}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m) \leq \text{card } \mathcal{E}_1 + \dots + \text{card } \mathcal{E}_m$.

Thus $\dim(V_1 + \dots + V_m) \leq \dim V_1 + \dots + \dim V_m$. \square

COMMENT: $\dim(V_1 + \dots + V_m) = \dim V_1 + \dots + \dim V_m \iff V_1 + \dots + V_m$ is a direct sum.

$\iff (\mathcal{E}_1 \cap \dots \cap \mathcal{E}_{k-1}) \cap \mathcal{E}_k = \emptyset$ for each k $\text{and } \dim \text{span}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m) = \text{card}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m)$

$\iff \dim \text{span}(\mathcal{E}_1 \cup \dots \cup \mathcal{E}_m) = \text{card } \mathcal{E}_1 + \dots + \text{card } \mathcal{E}_m$

$\iff \dim(V_1 + \dots + V_m) = \dim V_1 + \dots + \dim V_m$. \square

17 Suppose V_1, V_2, V_3 are subsp of a finite-dim vecsp, then

$$\dim(V_1 + V_2 + V_3) = \dim V_1 + \dim V_2 + \dim V_3$$

$$- \dim(V_1 \cap V_2) - \dim(V_1 \cap V_3) - \dim(V_2 \cap V_3) + \dim(V_1 \cap V_2 \cap V_3).$$

Explain why you might think and prove the formula above or give a counterexample.

SOLUTION:

[Similar to] Given three sets A, B and C .

Because $|X + Y| = |X| + |Y| - |X \cap Y|$; $(X \cup Y) \cap Z = (X \cap Z) \cup (Y \cap Z)$.

Now $|(A \cup B) \cup C| = |A \cup B| + |C| - |(A \cup B) \cap C|$.

And $|(A \cup B) \cap C| = |(A \cap C) \cup (B \cap C)| = |A \cap C| + |B \cap C| - |A \cap B \cap C|$.

Hence $|(A \cup B) \cup C| = |A| + |B| + |C| + |A \cap B \cap C| - |A \cap B| - |A \cap C| - |B \cap C|$.

Because $(V_1 + V_2) + V_3 = V_1 + (V_2 + V_3) = (V_1 + V_3) + V_2$.

$$\dim(V_1 + V_2 + V_3) = \dim(V_1 + V_2) + \dim(V_3) - \dim((V_1 + V_2) \cap V_3) \quad (1)$$

$$= \dim(V_2 + V_3) + \dim(V_1) - \dim((V_2 + V_3) \cap V_1) \quad (2)$$

$$= \dim(V_1 + V_3) + \dim(V_2) - \dim((V_1 + V_3) \cap V_2) \quad (3)$$

Notice that in general, $(X + Y) \cap Z \neq X \cap Z + Y \cap Z$.

For example, $X = \{(x, 0) \in \mathbb{R}^2 : x \in \mathbb{R}\}, Y = \{(0, y) \in \mathbb{R}^2 : y \in \mathbb{R}\}, Z = \{(z, z) \in \mathbb{R}^2 : z \in \mathbb{R}\}$.

• **COROLLARY:** Suppose V_1, V_2 and V_3 are finite-dim vecsp, then $\frac{(1) + (2) + (3)}{3}$:

$$\dim(V_1 + V_2 + V_3) = \dim V_1 + \dim V_2 + \dim V_3$$

$$- \frac{\dim(V_1 \cap V_2) + \dim(V_1 \cap V_3) + \dim(V_2 \cap V_3)}{3}$$

$$+ \frac{\dim((V_1 + V_2) \cap V_3) + \dim((V_1 + V_3) \cap V_2) + \dim((V_2 + V_3) \cap V_1)}{3}.$$

The formula above may seem strange because the right side does not look like an integer. \square

• **TIPS:** Because $\dim(V_1 \cap V_2 \cap V_3) = \dim V_1 + \dim(V_2 \cap V_3) - \dim(V_1 + (V_2 \cap V_3))$.

And $\dim(V_2 \cap V_3) = \dim V_2 + \dim V_3 - \dim(V_2 + V_3)$. We have (1), and (2), (3) similarly.

(1) $\dim(V_1 \cap V_2 \cap V_3) = \dim V_1 + \dim V_2 + \dim V_3 - \dim(V_2 + V_3) - \dim(V_1 + (V_2 \cap V_3))$.

(2) $\dim(V_1 \cap V_2 \cap V_3) = \dim V_1 + \dim V_2 + \dim V_3 - \dim(V_1 + V_3) - \dim(V_2 + (V_1 \cap V_3))$.

(3) $\dim(V_1 \cap V_2 \cap V_3) = \dim V_1 + \dim V_2 + \dim V_3 - \dim(V_1 + V_2) - \dim(V_3 + (V_1 \cap V_2))$.

- Suppose V is a 10-dim vecsp and V_1, V_2, V_3 are subsp of V with
 - (a) $\dim V_1 = \dim V_2 = \dim V_3 = 7$. Prove that $V_1 \cap V_2 \cap V_3 \neq \{0\}$.
 By TIPS, $\dim(V_1 \cap V_2 \cap V_3) \geq \dim V_1 + \dim V_2 + \dim V_3 - \underline{2 \dim V} > 0$.
 - (b) $\dim V_1 + \dim V_2 + \dim V_3 > 2 \dim V$. Prove that $V_1 \cap V_2 \cap V_3 \neq \{0\}$.

Let $B_V = (v_1, \dots, v_n)$ be a basis of V . Let (w_1, \dots, w_m) be linely inde in W for any $m \in \mathbf{N}^+$.

Linearity checked. Now suppose $a_1 T_{x,1} + \dots + a_m T_{x,m} = 0$.

SOLUTION:

We prove by contradiction. By linear dependence lemma, $\exists j \in \{1, \dots, m\}, v_j \in \text{span}(v_1, \dots, v_{j-1})$.

Fix j . Let $w_j \neq 0$, while $w_1 = \dots = w_{j-1} = w_{j+1} = \dots = w_m = 0$. Define $T \in \mathcal{L}(V, W)$ by $Tv_k = w_k$ for each k .

Suppose $a_1v_1 + \dots + a_mv_m = 0$, where $a_j \neq 0$.

Then $T(a_1v_1 + \dots + a_mv_m) = 0 = a_1w_1 + \dots + a_mw_m = a_jw_j$ while $a_j \neq 0$ and $w_j \neq 0$. Contradicts. \square

OR. We prove the contrapositive: Suppose $\forall w_1, \dots, w_m \in W, \exists T \in \mathcal{L}(V, W), Tv_k = w_k$ for each w_k .

Now we show that (v_1, \dots, v_n) is linely inde. Suppose $\exists a_i \in \mathbf{F}, a_1v_1 + \dots + a_nv_n = 0$.

Choose one $w \in W \setminus \{0\}$. By assumption, for $(\overline{a_1}w, \dots, \overline{a_m}w), \exists T \in \mathcal{L}(V, W), Tv_k = \overline{a_k}w$ for each v_k .

Now we have $0 = T\left(\sum_{k=1}^m a_kv_k\right) = \sum_{k=1}^m a_kTv_k = \sum_{k=1}^m a_k\overline{a_k}w = \left(\sum_{k=1}^m |a_k|^2\right)w$.

Then $\sum_{k=1}^m |a_k|^2 = 0 \implies \text{each } a_k = 0$. Hence (v_1, \dots, v_n) is linely inde. \square

Suppose V is finite-dim. Show that the only two-sided ideals of $\mathcal{L}(V)$ are $\{0\}$ and $\mathcal{L}(V)$.

A subsp \mathcal{E} of $\mathcal{L}(V)$ is called a two-sided ideal of $\mathcal{L}(V)$ if $TE \in \mathcal{E}, ET \in \mathcal{E}, \forall E \in \mathcal{E}, T \in \mathcal{L}(V)$.

SOLUTION: Let (v_1, \dots, v_n) be a basis of V . If $\mathcal{E} = 0$, then we are done.

Suppose $\mathcal{E} \neq 0$ and \mathcal{E} is a two-sided ideal of $\mathcal{L}(V)$. Let $S \in \mathcal{E} \setminus \{0\}$.

Suppose $Sv_i \neq 0$ and $Sv_i = a_1v_1 + \dots + a_nv_n$, where $a_k \neq 0$.

Define $R_{x,y} \in \mathcal{L}(V)$ by $R_{x,y} : v_x \mapsto v_y, v_z \mapsto 0 (z \neq x)$. OR. $R_{x,y}v_z = \delta_{z,x}v_y$.

Then $(R_{1,1} + \dots + R_{n,n})v_j = v_j \implies \sum_{r=1}^n R_{r,r} = I$. Assume that each $R_{x,y} \in \mathcal{E}$.

Hence $\forall T \in \mathcal{L}(V), I \circ T = T \circ I = T \in \mathcal{E} \implies \mathcal{E} = \mathcal{L}(V)$. Now we prove the assumption.

Notice that $\forall x, y \in \mathbf{N}^+, (R_{k,y}S)(v_i) = a_kv_y \implies ((R_{k,y}S) \circ R_{x,i})(v_z) = \delta_{z,x}(a_kv_y)$.

Thus $R_{k,y}SR_{x,i} = a_kR_{x,y}$. Now $S \in \mathcal{E} \implies R_{k,y}S \in \mathcal{E} \implies R_{x,y} \in \mathcal{E}$. \square

• (4E 3.B.32)

Suppose V is finite-dim with $n = \dim V > 1$.

Show that if $\varphi : \mathcal{L}(V) \rightarrow \mathbf{F}$ is linear and $\forall S, T \in \mathcal{L}(V), \varphi(ST) = \varphi(S) \cdot \varphi(T)$, then $\varphi = 0$.

SOLUTION:

Using notations in (4E 3.A.17). Using the result in NOTE FOR [3.60].

Suppose $\varphi \neq 0 \implies \exists i, j \in \{1, \dots, n\}, \varphi(R_{i,j}) \neq 0$. Because $R_{i,j} = R_{x,j} \circ R_{i,x}, \forall x = 1, \dots, n$

$\implies \varphi(R_{i,j}) = \varphi(R_{x,j}) \cdot \varphi(R_{i,x}) \neq 0 \implies \varphi(R_{x,j}) \neq 0$ and $\varphi(R_{i,x}) \neq 0$.

Again, because $R_{i,x} = R_{y,x} \circ R_{i,y}, \forall y = 1, \dots, n$. Thus $\varphi(R_{y,x}) \neq 0, \forall x, y = 1, \dots, n$.

Let $k \neq i, j \neq l$ and then $\varphi(R_{i,j} \circ R_{l,k}) = \varphi(R_{l,k} \circ R_{i,j}) = \varphi(0) = 0 = \varphi(R_{l,k}) \cdot \varphi(R_{i,j})$

$\implies \varphi(R_{l,k}) = 0$ or $\varphi(R_{i,j}) = 0$. Contradicts. \square

OR. Note that by (4E 3.A.17), $\exists S, T \in \mathcal{L}(V), ST - TS \neq 0$.

Then $\varphi(ST - TS) = \varphi(S)\varphi(T) - \varphi(T)\varphi(S) = 0 \implies ST - TS \in \text{null } \varphi \neq \{0\}$.

Note that $\forall E \in \text{null } \varphi, T \in \mathcal{L}(V), \varphi(ET) = \varphi(TE) = 0 \implies ET, TE \in \text{null } \varphi$.

Hence $\text{null } \varphi$ is a nonzero two-sided ideal of $\mathcal{L}(V)$. \square

- Suppose V is finite-dim. $T \in \mathcal{L}(V)$ is such that $\forall S \in \mathcal{L}(V), ST = TS$.
Prove that $\exists \lambda \in \mathbf{F}, T = \lambda I$.

SOLUTION:

If $V = \{0\}$, then we are done. Now suppose $V \neq \{0\}$.

Assume that $\forall v \in V, (v, Tv)$ is linely depe, then by (2.A.2.(b)), $\exists \lambda_v \in \mathbf{F}, Tv = \lambda_v v$.

To prove that λ_v is independent of v , we discuss in two cases:

$$\left. \begin{aligned} (-) \text{ If } (v, w) \text{ is linely inde, } \lambda_{v+w}(v+w) &= T(v+w) = Tv + Tw = \lambda_v v + \lambda_w w \\ &\Rightarrow (\lambda_{v+w} - \lambda_v)v + (\lambda_{v+w} - \lambda_w)w = 0 \\ (=) \text{ Otherwise, suppose } w = cv, \lambda_w w &= Tw = cTv = c\lambda_v v = \lambda_v w \Rightarrow (\lambda_w - \lambda_v)w = 0 \end{aligned} \right\} \Rightarrow \lambda_w = \lambda_v.$$

Now we prove the assumption. Assume that $\exists v \in V, (v, Tv)$ is linely inde. Let $B_V = (v, Tv, u_1, \dots, u_n)$.

Define $S \in \mathcal{L}(V)$ by $S(av + bTv + c_1 u_1 + \dots + c_n u_n) = bv \Rightarrow S(Tv) = v = T(Sv) = 0$. Contradicts. \square

OR. Let (v_1, \dots, v_m) be a basis of V .

Define $\varphi \in \mathcal{L}(V, \mathbf{F})$ by $\varphi(v_1) = \dots = \varphi(v_m) = 1$. Let $\lambda = \varphi(Tv_1) \in \mathbf{F}$.

For any $v \in V$, define $S_v \in \mathcal{L}(V)$ by $S_v u = \varphi(u)v$.

Then $Tv = T(\varphi(v_1)v) = T(S_v v_1) = S_v(Tv_1) = \varphi(Tv_1)v = \lambda v$. \square

OR. For each $k \in \{1, \dots, n\}$, define $S_k \in \mathcal{L}(V)$ by $S_k v_j = \begin{cases} v_k, & j = k, \\ 0, & j \neq k. \end{cases}$ OR. $S_k v_j = \delta_{j,k} v_k$

Note that $S_k \left(\sum_{i=1}^n a_i v_i \right) = a_k v_k$. Then $S_k v = v \iff \exists ! a_k \in \mathbf{F}, v = a_k v_k$.

Hence $S_k(Tv_k) = T(S_k v_k) = Tv_k \Rightarrow Tv_k = a_k v_k$.

Define $A^{(j,k)} \in \mathcal{L}(V)$ by $A^{(j,k)} v_j = v_k, A^{(j,k)} v_k = v_j, A^{(j,k)} v_x = 0, x \neq j, k$.

Then $A^{(j,k)} T v_j = T A^{(j,k)} v_j = T v_k = a_k v_k; A^{(j,k)} T v_j = A^{(j,k)} a_j v_j = a_j A^{(j,k)} v_j = a_j v_k$.

Hence $a_k = a_j$. Thus a_k is independent of v_k . \square

(a) Show that $\text{range } T = \text{range } T|_X + \text{range } T|_Y$.

(b) Show that if $X \cap Y = \{0\}$, then $\text{range } T|_X \cap \text{range } T|_Y = \{0\}$.

SOLUTION:

(a) Because $\forall v \in V, \exists! u \in U, u_0 \in \text{null } T \Rightarrow \exists x \in X, y \in Y, v = (x + y) + u_0$.

Now $T v = T x + T y \Rightarrow \text{range } T = \text{range } T|_X + \text{range } T|_Y$.

(b) Assume that for some $v \in V$, there exist two distinct pairs $(x_1, y_1), (x_2, y_2)$ in $X \times Y$

such that $T v = T x_1 + T y_1 = T x_2 + T y_2$. Because $\forall v \in X \oplus Y, \exists! (x, y) \in X \times Y, v = x + y$.

Now $T(x_1 + y_1) = T(x_2 + y_2) \Rightarrow x_1 + y_1 = x_2 + y_2 \Rightarrow x_1 = x_2, y_1 = y_2$. Contradicts.

Thus $\forall T v \in \text{range } T, \exists! T x \in \text{range } T|_X, T y \in \text{range } T|_Y, T v = T x + T y$. □

26 Suppose $D \in \mathcal{L}(\mathcal{P}(\mathbf{R}), \mathcal{P}(\mathbf{R}))$ such that $\forall p \in \mathcal{P}(\mathbf{R}), \deg(Dp) = (\deg p) - 1$.

Prove that $D \in \mathcal{P}(\mathbf{R})$ is surj.

SOLUTION: NOTICE that the following proof is wrong:

Because $\text{span}(Dx, Dx^2, Dx^3, \dots) \subseteq \text{range } D$, and $\deg Dx^n = n - 1$.

又 By (2.C.10), $\text{span}(Dx, Dx^2, Dx^3, \dots) = \text{span}(1, x, x^2, \dots) = \mathcal{P}(\mathbf{R})$.

We will recursively define a sequence of polys $(p_k)_{k=0}^\infty$ where $Dp_k = x^k$.

(i) Because $\deg Dx = (\deg x) - 1 = 0$, we have $Dx = C \in \mathbf{F} \setminus \{0\}$.

Define $p_0 = C^{-1}x$. Then $Dp_0 = C^{-1}Dx = 1$.

(ii) Suppose we have defined p_0, \dots, p_n such that $Dp_k = x^k$ for each $k \in \{0, \dots, n\}$.

Because $\deg D(x^{n+2}) = n + 1$. Let $D(x^{n+2}) = a_{n+1}x^{n+1} + a_nx^n + \dots + a_1x + a_0$, where $a_{n+1} \neq 0$.

Then $a_{n+1}^{-1}D(x^{n+2}) = x^{n+1} + a_{n+1}^{-1}(a_nDp_n + \dots + a_1Dp_1 + a_0Dp_0)$

$\Rightarrow x^{n+1} = D(a_{n+1}^{-1}(x^{n+2} - a_n p_n - \dots - a_1 p_1 - a_0 p_0))$.

Thus defining $p_{n+1} = a_{n+1}^{-1}(x^{n+2} - a_n p_n - \dots - a_1 p_1 - a_0 p_0)$, we have $Dp_{n+1} = x^{n+1}$.

Now we get $(p_k)_{k=0}^\infty$ by recursion. Hence $\forall p = \sum_{k=0}^{\deg p} a_k x^k \in \mathcal{P}(\mathbf{R}), \exists q = (\sum_{k=0}^{\deg p} a_k p_k), Dq = p$. □

OR. Let $D(C) = 0, Dx^k = p_k$ of $\deg(k - 1)$ for all $C \in \mathbf{R} = \mathcal{P}(\mathbf{R})$ and for each $k \in \mathbf{N}^+$.

Note that for any $m \in \mathbf{N}^+, (p_1, \dots, p_m, p_{m+1})$ is a basis of $\mathcal{P}_m(\mathbf{R})$.

For $q = 0 \in \mathcal{P}(\mathbf{R}), \deg q = -\infty, \exists p = C \in \mathcal{P}_0(\mathbf{R}), Dp = q = 0$.

For all nonzero $q \in \mathcal{P}(\mathbf{R}), \exists! m \in \mathbf{N}, \deg q = m$, so that $q \in \mathcal{P}_m(\mathbf{R})$.

Now $\exists! a_k \in \mathbf{R}, q = a_{m+1}p_{m+1} + \dots + a_1p_1 = D(a_{m+1}x^{m+1} + \dots + a_1x)$. Thus $\exists p \in \mathcal{P}_{m+1}(\mathbf{R}), Dp = q$. □

SOLUTION: Define $B \in \mathcal{L}(\mathcal{P}(\mathbf{R}))$ by $B = 5D^2 + 3D \Rightarrow B(q) = 5q'' + 3q'$.

Note that $\deg Bx^n = n - 1$. Similar to Problem (26), we conclude that B is surj. □

Prove that $\exists C \in \mathbf{F}^{m,r}, R \in \mathbf{F}^{r,n}, A = CR.$

SOLUTION: Notice that $A \neq 0 \Rightarrow c, r \geq 1.$

(a) Let $(C_{\cdot,1}, \dots, C_{\cdot,c})$ be a basis of $S_c,$ forming $C \in \mathbf{F}^{m,c}.$ Then $\forall k \in \{1, \dots, n\},$

$A_{\cdot,k} = R_{1,k} C_{\cdot,1} + \dots + R_{c,k} C_{\cdot,c} = (CR)_{\cdot,k} \exists! R_{1,k}, \dots, R_{c,k} \in \mathbf{F},$ forming $R \in \mathbf{F}^{c,n}.$ Thus $A = CR.$

(b) Let $(R_{1,\cdot}, \dots, R_{r,\cdot})$ be a basis of $S_r,$ forming $R \in \mathbf{F}^{r,n}.$ Then $\forall j \in \{1, \dots, m\},$

$A_{j,\cdot} = C_{j,1} R_{1,\cdot} + \dots + C_{j,r} R_{r,\cdot} = (CR)_{j,\cdot} \exists! C_{j,1}, \dots, C_{j,r} \in \mathbf{F},$ forming $C \in \mathbf{F}^{m,r}.$ Thus $A = CR.$ □

EXAMPLE:

$$A = \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \\ 46 & 33 & 20 & 7 \end{pmatrix} \stackrel{(1)}{=} \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \end{pmatrix} \stackrel{(2)}{=} \begin{pmatrix} 7 & 4 \\ 19 & 12 \\ 33 & 20 \end{pmatrix} \begin{pmatrix} 2 & -1 \\ 1 & 0 \\ 0 & 1 \\ -1 & 2 \end{pmatrix}$$

$$(I) \begin{pmatrix} 46 & 33 & 20 & 7 \end{pmatrix} = 2 \begin{pmatrix} 10 & 7 & 4 & 1 \end{pmatrix} + \begin{pmatrix} 26 & 19 & 12 & 5 \end{pmatrix}.$$

$\begin{pmatrix} 46 & 33 & 20 & 7 \end{pmatrix}$ can be uniquely written as a linear combination of $(A_{1,\cdot}, A_{2,\cdot}).$

Hence $\dim S_r = 2.$ $(A_{1,\cdot}, A_{2,\cdot})$ is a basis.

$$(II) \begin{pmatrix} 10 \\ 26 \\ 46 \end{pmatrix} = 2 \begin{pmatrix} 7 \\ 19 \\ 33 \end{pmatrix} - \begin{pmatrix} 4 \\ 12 \\ 20 \end{pmatrix}; \quad \begin{pmatrix} 1 \\ 5 \\ 7 \end{pmatrix} = 2 \begin{pmatrix} 4 \\ 12 \\ 20 \end{pmatrix} - \begin{pmatrix} 7 \\ 19 \\ 33 \end{pmatrix}. \text{ Hence } \dim S_c = 2. - 1 Suppose $T \in \mathcal{L}(V, W)$. Show that with resp to each choice of bases of V and W , the matrix of T has at least $\dim \text{range } T$ nonzero entries.

Let $B_{\text{null } T} = (v_1, \dots, v_p), B_V = (v_1, \dots, v_n)$. Let $B_W = (w_1, \dots, w_m)$. Denote $\mathcal{M}(T, B_V, B_W)$ by A .

Because at most p of the v_k 's can belong to $\text{null } T \iff$ at least $n - p = q$ of the v_k 's do not.

For $v_k \notin \text{null } T, T v_k = A_{1,k} w_1 + \dots + A_{m,k} w_m \neq 0$. Thus col k has at least one nonzero entry.

Since there are $(n - p) = q$ choices of such k , A has at least $q = \dim \text{range } T$ nonzero entries. \square

OR. We prove by contradiction.

Suppose A has at most $(\dim \text{range } T - 1)$ nonzero entries.

If $A_{1,1} = 0$, then let $B_V = (u_1, \dots, u_n)$, we are done.

SOLUTION:

(a) Suppose $B_V = (v_1, \dots, v_n), B_W = (w_1, \dots, w_m)$ are the bases such that all entries of A equal 1.

Then $Tv_i = w_1 + \dots + w_m$ for all $i = 1, \dots, n$. Because w_1, \dots, w_m is linearly inde, $w_1 + \dots + w_m \neq 0$.

• Prove that the commutativity does not hold in $\mathbf{F}^{m,n}$.

Suppose $\dim V = n, \dim W = m$ and the commutativity holds in $\mathbf{F}^{n,m}$.

$\forall T \in \mathcal{L}(V, W), S \in \mathcal{L}(W, V), \mathcal{M}(TS) = \mathcal{M}(T)\mathcal{M}(S) = \mathcal{M}(S)\mathcal{M}(T) = \mathcal{M}(ST)$.

Hence $ST = TS$. Which in general is not true. (See 3.D) \square

• [10.A.3, OR 4E 3.D.19] Suppose V is finite-dim and $T \in \mathcal{L}(V)$.

Prove that $\forall B_V \neq B'_V, \mathcal{M}(T, B_V) = \mathcal{M}(T, B'_V) \iff T = \lambda \mathcal{M}(I), \exists \lambda \in \mathbf{F}$.

SOLUTION: [Compare with the first solution of (3.D.16) in 3.A]

Suppose $T = \lambda I$ for some $\lambda \in \mathbf{F}$. Then $T = \lambda \mathcal{M}(I)$.

Suppose $\forall B_V \neq B'_V, \mathcal{M}(T, B_V) = \mathcal{M}(T, B'_V)$. If $T = 0$, then we are done.

Suppose $T \neq 0$, and $v \in V \setminus \{0\}$. Assume that (v, Tv) is linely inde.

Extend (v, Tv) to $B_V = (v, Tv, u_3, \dots, u_n)$. Let $B = \mathcal{M}() (T, B_V)$.

$$\Rightarrow Tv = B_{1,1}v + B_{2,1}(Tv) + B_{3,1}u_3 + \dots + B_{n,1}u_n \Rightarrow B_{2,1} = 1, B_{i,1} = 0, \forall i \neq 2.$$

By assumption, $A = \mathcal{M}(T, B'_V) = B, \forall B'_V = (v, w_2, \dots, w_n)$. Then $A_{2,1} = 1, A_{i,1} = 0, \forall i \neq 2$.

$\Rightarrow Tv = w_2$, which is not true if we let $w_2 = u_3, w_3 = Tv, w_j = u_j, \forall j \in \{4, \dots, n\}$. Contradicts.

Hence (v, Tv) is linely depe $\Rightarrow \forall v \in V, \exists \lambda_v \in \mathbf{F}, Tv = \lambda_v v$.

Now we show that λ_v is independent of v , that is, to show that for all $v \neq w \in V \setminus \{0\}, \lambda_v = \lambda_w$.

$$\left. \begin{aligned} (v, w) \text{ is linely inde} &\Rightarrow T(v+w) = \lambda_{v+w}(v+w) = \lambda_v v + \lambda_w w = Tv + Tw \\ (v, w) \text{ is linely depe, } w &= cv \Rightarrow Tw = \lambda_w w = \lambda_w cv = c\lambda_v v = T(cv) \end{aligned} \right\} \Rightarrow T = \lambda I, \exists \lambda \in \mathbf{F}. \quad \square$$

OR. Conversely, denote $\mathcal{M}(T, B_V)$ by A , where $B_V = (u_1, \dots, u_m)$ is arbitrary.

Fix one $B_V = (v_1, \dots, v_m)$ and then $(v_1, \dots, \frac{1}{2}v_k, \dots, v_m)$ is also a basis for any given $k \in \{1, \dots, m\}$.

Fix one k . Now we have $T(\frac{1}{2}v_k) = A_{1,k}v_1 + \dots + A_{k,k}(\frac{1}{2}v_k) + \dots + A_{m,k}v_m$

$$\Rightarrow Tv_k = 2A_{1,k}v_1 + \dots + A_{k,k}v_k + \dots + 2A_{m,k}v_m = A_{1,k}v_1 + \dots + A_{k,k}v_k + \dots + A_{m,k}v_m.$$

Then $A_{j,k} = 2A_{j,k} \Rightarrow A_{j,k} = 0$ for all $j \neq k$. Thus $Tv_k = A_{k,k}v_k, \forall k \in \{1, \dots, m\}$.

Now we show that $A_{k,k} = A_{j,j}$ for all $j \neq k$. Choose j, k such that $j \neq k$.

Consider the basis $B'_V = (v'_1, \dots, v'_j, \dots, v'_k, \dots, v'_m)$,

where $v'_j = v_k, v'_k = v_j$ and $v'_i = v_i$ for all $i \in \{1, \dots, m\} \setminus \{j, k\}$.

Remember that $\mathcal{M}(T, B'_V) = \mathcal{M}(T, B_V) = A$.

Hence $T(v'_k) = A_{1,k}v'_1 + \dots + A_{k,k}v'_k + \dots + A_{m,k}v'_m = A_{k,k}v'_k = A_{k,k}v_j$, while $T(v'_k) = T(v_j) = A_{j,j}v_j$.

Thus $A_{k,k} = A_{j,j}$. \square

Prove that $\exists \lambda \in \mathbf{F}, S = \lambda I$.

SOLUTION: Using the notation and result in ().

Suppose $ST = TS$ for every $T \in \mathcal{L}(V)$. If $S = 0$, we are done. Now suppose $S \neq 0$.

Let $S = E_{1,1} + \dots + E_{m,m} \Rightarrow \mathcal{M}(S, B_{\mathcal{K}}) = \mathcal{M}(I, B_{\text{range } S}, B_{\mathcal{K}})$.

Then $\forall k \in \{m+1, \dots, n\}, 0 \neq SR_{k,1} = R_{k,1}S$. Hence $n = \dim V = \dim \text{range } S = m$.

NOTICE that $R_{i,j}S = SR_{i,j} \iff Q_{i,j} = G_{i,j}$. Thus $Q_{i,j}(w_i) = w_j = a_{i,i}v_j = G_{i,j}(a_{1,i}v_1 + \dots + a_{n,i}v_n)$.

And For each j , for all i . Thus $a_{i,i} = a_{k,k} = \lambda, \forall k \neq i$.

(b) Using mathematical induction.

(i) $\deg p = 0 \Rightarrow p = C \Rightarrow \deg Tp = \deg p = 0$;

$\deg p = -\infty \Rightarrow p = 0 \Rightarrow \deg Tp = \deg p = -\infty$.

(ii) Assume that $\forall s \in \mathcal{P}_n(\mathbf{R}), \deg s = \deg Ts$.

SOLUTION:

Define $T : (v_1, \dots, v_m) \rightarrow \varphi$, where $\varphi : (a_1, \dots, a_m) \mapsto v$ is defined by $\varphi(a_1, \dots, a_m) = a_1v_1 + \cdots + a_mv_m$.

(a) Suppose $T(v_1, \dots, v_m) = 0$. Then $\forall (a_1, \dots, a_m) \in \mathbb{F}^m, \varphi(a_1, \dots, a_m) = a_1v_1 + \cdots + a_mv_m = 0$

$\Rightarrow (v_1, \dots, v_m) = 0 \Rightarrow T$ is inje.

(b) Suppose $\psi \in \mathcal{L}(\mathbb{F}^m, V)$. Let (e_1, \dots, e_m) be the standard basis of \mathbb{F}^m . Then $\forall (b_1, \dots, b_m) \in \mathbb{F}^m$,

$\left[T(\psi(e_1), \dots, \psi(e_m)) \right] (b_1, \dots, b_m) = b_1\psi(e_1) + \cdots + b_m\psi(e_m) = \psi(b_1e_1 + \cdots + b_me_m) = \psi(b_1, \dots, b_m)$.

Thus $T(\psi(e_1), \dots, \psi(e_m)) = \psi$. Hence T is surj. □

14 Suppose $U = \{(x_1, x_2, \dots) \in \mathbf{F}^\infty : x_k \neq 0 \text{ for only finitely many } k\}$.

(a) Show that U is a subspace of \mathbf{F}^∞ . [Do it in your mind]

(b) Prove that \mathbf{F}^∞/U is infinite-dim.

SOLUTION: For ease of notation, denote the p^{th} term of $u = (x_1, \dots, x_p, \dots) \in \mathbf{F}^\infty$ by $u[p]$.

For each $r \in \mathbf{N}^+$, let $e_r[p] = \begin{cases} 1, & (p-1) \equiv 0 \pmod{r} \\ 0, & \text{otherwise} \end{cases}$ simply $e_r = (1, \underbrace{0, \dots, 0}_{(p-1) \text{ times}}, 1, \underbrace{0, \dots, 0}_{(p-1) \text{ times}}, 1, \dots)$.

Choose one $m \in \mathbf{N}^+$. Let $a_1(e_1 + U) + \dots + a_m(e_m + U) = 0 + U \Rightarrow \exists u \in U, a_1e_1 + \dots + a_me_m = u$.

Suppose $u = (x_1, \dots, x_L, 0, \dots)$, where L is the largest such that $u[L] \neq 0$.

Let $s \in \mathbf{N}^+$ be such that $h = s \cdot m! + 1 > L$ and $e_1[h] = \dots = e_m[h] = 1$.

Note that by definition, $e_r[s \cot m! + 1 + p] = e_r[p + 1] = 1 \Leftrightarrow p \equiv 0 \pmod{r} \Leftrightarrow r | p$.

Now for any $p \in \{1, \dots, m\}$, $u[h + p] = \left(\sum_{r=1}^m a_r e_r \right) [p + 1] = \sum_{k=1}^{\tau(p)} a_{p_k} = 0$ (Δ)

where $1 = p_1 \leq \dots \leq p_{\tau(p)} = p$ are all the distinct factors of p .

Let $q = p_{\tau(p)-1}$. Notice that $\tau(q) = \tau(p) - 1$ and $q_k = p_k, \forall k \in \{1, \dots, \tau(q)\}$.

Again by (Δ), $\left(\sum_{r=1}^m a_r e_r \right) [h + q] = \sum_{k=1}^{\tau(p)-1} a_{p_k} = 0$. Thus $a_{p_{\tau(p)}} = a_p = 0$ for any $p \in \{1, \dots, m\}$.

Hence $\forall m \in \mathbf{N}^+$, (e_1, \dots, e_m) is linearly inde in \mathbf{F}^∞ , so is $(e_1 + U, \dots, e_m + U)$ in \mathbf{F}^∞/U . By (2.A.14). □

OR. For each $r \in \mathbf{N}^+$, let $e_r[p] = \begin{cases} 1, & \text{if } 2^r | p \\ 0, & \text{otherwise} \end{cases}$.

Similarly, let $m \in \mathbf{N}^+$ and $a_1(e_1 + U) + \dots + a_m(e_m + U) = 0 \Rightarrow a_1e_1 + \dots + a_me_m = u \in U$.

Suppose L is the largest such that $u[L] \neq 0$. And l is such that $2^{ml} > L$.

Then $\forall k \in \{1, \dots, m\}, u[2^{ml} + 2^k] = \left(\sum_{r=1}^m a_r e_r \right) [2^k] = a_1 + \dots + a_k = 0$.

Thus $a_1 = \dots = a_m = 0$ and (e_1, \dots, e_m) is linearly inde. Similarly. □

7 Suppose $v, x \in V$ and U and W are subspaces of V . Prove that $v + U = x + W \Rightarrow U = W$.

SOLUTION:

(a) $\forall u_1 \in U, \exists w_1 \in W, v + u_1 = x + w_1$, let $u_1 = 0$, now $v = x + w'_1 \Rightarrow v - x \in W$.

(b) $\forall w_2 \in W, \exists u_2 \in U, v + u_2 = x + w_2$, let $w_2 = 0$, now $x = v + u'_2 \Rightarrow x - v \in U$.

Thus $\pm(v - x) \in U \cap W \Rightarrow \begin{cases} u_1 = (x - v) + w_1 \in W \Rightarrow U \subseteq W \\ w_2 = (v - x) + u_2 \in U \Rightarrow W \subseteq U \end{cases} \Rightarrow U = W$. □

Then A is a translate of $U \Leftrightarrow \exists c \in \mathbf{R}, A = \{(x, y, z) \in \mathbf{R}^3 : 2x + 3y + 5z = c\}$.

• Suppose $T \in \mathcal{L}(V, W)$ and $c \in W$. Prove that $U = \{x \in V : Tx = c\}$ is either \emptyset or is a translate of $\text{null } T$.

SOLUTION:

If $c \in W$ but $c \notin \text{range } T$, then $U = \emptyset$, we are done. Now suppose $c \in \text{range } T$ and $x \in U$.

$\forall x + y \in x + \text{null } T$ ($\forall y \in \text{null } T$), $x + y \in U$. Hence $x + \text{null } T \subseteq U$.

$\forall u \in U, u - x \in \text{null } T \Rightarrow u = x + (u - x) \in x + \text{null } T$. Hence $U \subseteq x + \text{null } T$. □

8 Suppose A is a nonempty subset of V .

Prove that A is a translate of some subsp of $V \iff \lambda v + (1 - \lambda)w \in A, \forall v, w \in A, \lambda \in \mathbb{F}$.

SOLUTION:

Suppose $A = a + U$. Then $\forall a + u_1, a + u_2 \in A, \lambda \in \mathbb{F}$,

$$\lambda(a + u_1) + (1 - \lambda)(a + u_2) = a + (\lambda(u_1 - u_2) + u_2) \in A.$$

Suppose $\lambda v + (1 - \lambda)w \in A, \forall v, w \in A, \lambda \in \mathbb{F}$. Suppose $a \in A$ and let $A' = \{x - a : x \in A\}$.

Then $0 \in A'$ and $\forall x - a, y - a \in A', (\forall x, y \in A), \lambda \in \mathbb{F}$,

$$(I) \lambda(x - a) = [\lambda x + (1 - \lambda)a] - a \in A'.$$

$$(II) \lambda(x - a) + (1 - \lambda)(y - a) = \frac{1}{2}(x - a) + \frac{1}{2}(y - a) = \frac{1}{2}x + (1 - \frac{1}{2})y - a \in A'.$$

$$\text{OR. By (I), } 2 \times [\frac{1}{2}(x - a) + \frac{1}{2}(y - a)] = (x - a) + (y - a) \in A'.$$

Thus A' is a subsp of V . Hence $a + A' = \{(x - a) + a : x \in A\} = A$ is a translate. \square

OR. Suppose $x - a, y - a \in A', \lambda \in \mathbb{F}$.

Note that $x, a \in A \Rightarrow \lambda x + (1 - \lambda)a = 2x - a \in A$. Similarly $2y - a \in A$.

$$(I) (x - \frac{1}{2}a) + (y - \frac{1}{2}a) = x + y - a \in A \Rightarrow x + y - 2a = (x - a) + (y - a) \in A'.$$

$$(II) \lambda(x - a) = (\lambda x + (1 - \lambda)a) - a \in A'.$$

Thus $-x + A$ is a subsp of V . Hence $A = x + (-x + A)$ is a translate of the subsp $(-x + A)$. \square

Suppose $v + u_1, w + u_2 \in A_1 \cap A_2 \neq \emptyset$. By Problem (8),

$\forall \lambda \in \mathbb{F}, \lambda(v + u_1) + (1 - \lambda)(w + u_2) \in A_1 \cap A_2$. Thus $A_1 \cap A_2$ is a translate of some subsp of V . \square

Note that by [3.85], $A_1 = v + U_1 = x + U_1, A_2 = w + U_2 = x + U_2$. We show that $A_1 \cap A_2 = x + (U_1 \cap U_2)$.

$$(a) y \in A_1 \cap A_2 \Rightarrow \exists u_1 \in U_1, u_2 \in U_2, y = x + u_1 = x + u_2 \Rightarrow u_1 = u_2 \in U_1 \cap U_2 \Rightarrow y \in x + (U_1 \cap U_2).$$

$$(b) y = x + u \in x + (U_1 \cap U_2) = (x + U_1) \cap (x + U_2) \Rightarrow y \in A_1 \cap A_2. \quad \square$$

Let $E = S \circ \pi$. Now $\text{null } E = \text{null } \pi = U$. Because π is surj $\text{range } (S \circ \pi) \subseteq \text{range } S$. $\text{range } E = \text{range } S$.

While we might have $\text{range } T = \text{span}(v_2 - 2v_1, v_3) = W$, depending on the choice of W .

Now $E : v_2 \mapsto v_2$; $v_2 - 2v_1 \mapsto v_2$. While $T : v_2 \mapsto v_2 - 2v_1$; $v_2 - 2v_1 \mapsto v_2 - 2v_1$.

(b) Let $W \in \mathcal{S}_V U$. In other words, reduce $(w_1 + U, \dots, w_n + U)$

to a basis $(w_1 + U, \dots, w_m + U)$ of V/U and let $W = \text{span}(w_1, \dots, w_m)$. □

OR. Let $(v_1 + U, \dots, v_m + U)$ be a basis of V/U and define $\tilde{T} \in \mathcal{L}(V/U, V)$ by $\tilde{T}(v_k + U) = v_k$.

(b) Suppose $W^0 \subseteq U^0$. Then $\varphi \in W^0 \Rightarrow \varphi \in U^0$. Hence $\text{null } \varphi \supseteq W \Rightarrow \text{null } \varphi \supseteq U$. Thus $W \supseteq U$.

31 Suppose V is finite-dim and $B_{V'} = (\varphi_1, \dots, \varphi_n)$. Show that the correspd B_V exists.

SOLUTION:

Using (3.B.29). Let $\varphi_i(u_i) = 1$ and then $V = \text{null } \varphi_i \oplus \text{span}(u_i)$ for each φ_i .

Suppose $a_1 u_1 + \dots + a_n u_n = 0$. Then $0 = \varphi_i(a_1 u_1 + \dots + a_n u_n) = a_i$ for each i .

By Problem (30) OR (4E 2.C.16), $\dim U_k = 1$. Thus $\exists u_k \in V, U_k = \text{span}(u_k) \neq 0$.

又 By Problem (30), $(\text{null } \varphi_1) \cap \dots \cap (\text{null } \varphi_n) = \{0\} = U \cap \text{null } \varphi_k$.

Then if $\varphi_k(u_k) = 0 \Rightarrow u_k \in \text{null } \varphi_k$ while $u_k \in U \Rightarrow u_k \in \{0\}$, contradicts.

Thus $\varphi_k(u_k) \neq 0$. Let $v_k = (\varphi_k(u_k))^{-1} u_k \Rightarrow \varphi_k(v_k) = 1$. Now for $j \neq k, u_k \in \text{null } \varphi_j \Rightarrow \varphi_j(v_k) = 0$.

Otherwise, $\text{null } \beta \neq \text{null } \varphi$. Then $\exists u' \in \text{null } \beta \setminus \text{null } \varphi$.

Now $a_1 \varphi_1 + \dots + a_m \varphi_m = 0 \Rightarrow 0(v_i) = a_i$ for each i . Hence $(\varphi_1, \dots, \varphi_m)$ is linely inde.

OR. Let $\text{span}(v_1, \dots, v_m) = U$. Then $B_{U'} = (\varphi_1|_U, \dots, \varphi_m|_U)$. Hence $(\varphi_1, \dots, \varphi_m)$ is linely inde. □

OR. Similar to Problem (6), we get $(e_1, \dots, e_m), (\psi_1, \dots, \psi_m)$ and the iso Ψ .

$\forall (x_1, \dots, x_m) \in \mathbf{F}^m, \Gamma'(\Psi(x_1, \dots, x_m)) = \Gamma'(\Psi(x_1 e_1 + \dots + x_m e_m)) = (x_1 \psi_1 + \dots + x_m \psi_m) \circ \Gamma$.

$\forall v \in V, [\Gamma'(\Psi(x_1, \dots, x_m))](v) = [x_1 \psi_1 + \dots + x_m \psi_m](\Gamma(v)) = [x_1 \varphi_1 + \dots + x_m \varphi_m](v)$.

Now $\Gamma'(\Psi(x_1, \dots, x_m)) = x_1 \varphi_1 + \dots + x_m \varphi_m$.

Define $\Phi : \mathbf{F}^m \rightarrow (\mathbf{F}^m)'$ by $\Phi = \Psi \circ \Gamma$. $\Phi(x_1, \dots, x_m) = x_1 \varphi_1 + \dots + x_m \varphi_m$. Thus by (4E 3.B.3),

(c) the inje of Φ correspds to $(\varphi_1, \dots, \varphi_m)$ spanning V' ; $\text{又 } \Phi = \Psi \circ \Gamma$ inje $\iff \Gamma$ inje.

(d) the surj of Φ correspds to $(\varphi_1, \dots, \varphi_m)$ being linely inde; $\text{又 } \Phi = \Psi \circ \Gamma$ surj $\iff \Gamma$ surj. □

35 Prove that $(\mathcal{P}(\mathbf{F}))'$ and \mathbf{F}^∞ are iso.

SOLUTION:

Define $\theta \in \mathcal{L}((\mathcal{P}(\mathbf{F}))', \mathbf{F}^\infty)$ by $\theta(\varphi) = (\varphi(1), \varphi(z), \dots, \varphi(z^n), \dots)$.

Inje: $\theta(\varphi) = 0 \Rightarrow \forall z^k$ in the basis $(1, z, \dots, z^n)$ of $\mathcal{P}_n(\mathbf{F})$ ($\forall n$), $\varphi(z^k) = 0 \Rightarrow \varphi = 0$.

[NOTICE that $\forall p \in \mathcal{P}(\mathbf{R}), \exists ! a_i \in \mathbf{F}, m = \deg p, p = a_0 z + a_1 z^2 + \dots + a_m z^m \in \mathcal{P}_m(\mathbf{F})$.]

Surj: $\forall (a_k)_{k=1}^\infty \in \mathbf{F}^\infty$, let ψ be such that $\forall k, \psi(z^k) = a_k$ [by [3.5]] and thus $\theta(\psi) = (a_k)_{k=1}^\infty$. \square

COMMENT: NOTICE that $\mathcal{P}(\mathbf{F})$ and \mathbf{F}^∞ are not iso, so are $\mathcal{P}(\mathbf{F})$ and $(\mathcal{P}(\mathbf{F}))'$

But if we let $\mathbf{F}^\infty = \{(a_1, \dots, a_n, \underbrace{0, \dots, 0}_{\text{all zero}}) \in \mathbf{F}^\infty \mid \exists ! n \in \mathbf{N}^+\}$. Then $\mathcal{P}(\mathbf{F})$ and \mathbf{F}^∞ are iso.

7 Show that the dual basis of $(1, x, \dots, x^m)$ of $\mathcal{P}_m(\mathbf{R})$ is $(\varphi_0, \varphi_1, \dots, \varphi_m)$, where $\varphi_k(p) = \frac{p^{(k)}(0)}{k!}$.

Here $p^{(k)}$ denotes the k^{th} derivative of p , with the understanding that the 0^{th} derivative of p is p .

SOLUTION:

$$\forall j, k \in \mathbf{N}, (x^j)^{(k)} = \begin{cases} j(j-1) \dots (j-k+1) \cdot x^{(j-k)}, & j \geq k. \\ j(j-1) \dots (j-j+1) = j! & j = k. \\ 0, & j \leq k. \end{cases} \quad \text{Then } (x^j)^{(k)}(0) = \begin{cases} 0, & j \neq k. \\ k!, & j = k. \end{cases} \quad \square$$

OR. Because $\forall j, k \in \{1, \dots, m\}$ such that $j \neq k$, $\varphi_k(x^j) = \frac{(x^j)^{(k)}(0)}{k!} = \frac{0}{k!} = 0$; $\varphi_k(x^k) = \frac{(x^k)^{(k)}(0)}{k!} = 1$.

Thus $\frac{p^{(k)}(0)}{k!}$ act exactly the same as φ_k on the same basis $(1, \dots, x^m)$, hence is just another def of φ_k . \square

EXAMPLE: Suppose $m \in \mathbf{N}^+$. By [2.C.10], $B = (1, x-5, \dots, (x-5)^m)$ is a basis of $\mathcal{P}_m(\mathbf{R})$.

Let $\varphi_k = \frac{p^{(k)}(5)}{k!}$ for each $k = 0, 1, \dots, m$. Then $(\varphi_0, \varphi_1, \dots, \varphi_m)$ is the dual basis of B .

34 The double dual space of V , denoted by V'' , is defined to be the dual space of V' .

In other words, $V'' = \mathcal{L}(V', \mathbf{F})$. Define $\Lambda : V \rightarrow V''$ by $(\Lambda v)(\varphi) = \varphi(v)$.

(a) Show that Λ is a linear map from V to V'' .

(b) Show that if $T \in \mathcal{L}(V)$, then $T'' \circ \Lambda = \Lambda \circ T$, where $T'' = (T')'$.

(c) Show that if V is finite-dim, then Λ is an iso from V onto V'' .

Suppose V is finite-dim. Then V and V' are iso, and finding an iso from V onto V' generally requires choosing a basis of V . In contrast, the iso Λ from V onto V'' does not require a choice of basis and thus is considered more natural.

SOLUTION:

(a) $\forall \varphi \in V', v, w \in V, a \in \mathbf{F}, (\Lambda(v+aw))(\varphi) = \varphi(v+aw) = \varphi(v) + a\varphi(w) = (\Lambda v)(\varphi) + a(\Lambda w)(\varphi)$.

Thus $\Lambda(v+aw) = \Lambda v + a\Lambda w$. Hence Λ is linear.

(b) $(T''(\Lambda v))(\varphi) = ((\Lambda v) \circ T')(\varphi) = (\Lambda v)(T'(\varphi))$
 $= (T'(\varphi))(v) = (\varphi \circ T)(v) = \varphi(Tv) = (\Lambda(Tv))(\varphi)$.

Hence $T''(\Lambda v) = (\Lambda(Tv)) \Rightarrow T'' \circ \Lambda = \Lambda \circ T$.

(c) Suppose $\Lambda v = 0$. Then $\forall \varphi \in V', (\Lambda v)(\varphi) = \varphi(v) = 0 \Rightarrow v = 0$. Thus Λ is inje.

又 Because V is finite-dim. $\dim V = \dim V' = \dim V''$. Hence Λ is an iso. \square
