

## 简介

这是我个人用于复习的笔记，一本习题补注。由于我个人的复习特点，我把许多对我个人而言没什么复习价值的习题作了省略。为什么我没有用中文？因为我将来要学习的绝大多数数学课本都是全英的，国内目前的专业翻译速度慢、不全面，况且对于专业学习者来说，直接使用英文不会造成任何困扰，并且我不愿意花费额外的时间去翻译，所以我用英文。但我讨厌英文单词的冗长性，这会让我复习起来很不爽，所以我对许多常用词汇适当地作了简写。这份笔记的内容范围和标识说明，我已经在[README](#)中写得很清楚，不再赘述。这份笔记尚处于缓慢的编撰进度中。

1 Prove that  $\forall v \in V, -(-v) = v$ .

SOLUTION:

$$\left. \begin{array}{l} -(-v) + (-v) = 0 \\ v + (-v) = 0 \end{array} \right\} \Rightarrow \text{By the uniqueness of add inv, we are done.}$$

$$\text{OR. } -(-v) = (-1)((-1)v) = ((-1)(-1))v = 1 \cdot v = v. \quad \square$$

2 Suppose  $a \in \mathbf{F}, v \in V$ , and  $av = 0$ . Prove that  $a = 0$  or  $v = 0$ .

SOLUTION:

$$\text{Suppose } a \neq 0, \exists a^{-1} \in \mathbf{F}, a^{-1}a = 1, \text{ hence } v = 1 \cdot v = (a^{-1}a)v = a^{-1}(av) = a^{-1} \cdot 0 = 0. \quad \square$$

3 Suppose  $v, w \in V$ . Explain why  $\exists! x \in V, v + 3x = w$ .

SOLUTION:

$$[\text{Existence}] \text{ Let } x = \frac{1}{3}(w - v).$$

$$[\text{Uniqueness}] \text{ Suppose } v + 3x_1 = w, \text{ (I) } v + 3x_2 = w \text{ (II). Then (I) - (II) : } 3(x_1 - x_2) = 0 \Rightarrow x_1 = x_2. \quad \square$$

$$\text{OR. } v + 3x = w \Leftrightarrow 3x = w - v \Leftrightarrow x = \frac{1}{3}(w - v). \quad \square$$

5 Show that in the def of a vecsp, the add inv condition can be replaced by [1.29].

*Hint:* Suppose  $V$  satisfies all conds in the def, except we've replaced the add inv cond with [1.29].

Prove that the add inv is true.

SOLUTION:

$$\text{Using [1.31]. } 0v = 0 \text{ for all } v \in V \Leftrightarrow (1 + (-1))v = 1 \cdot v + (-1)v = v + (-v) = 0. \quad \square$$

6 Let  $\infty$  and  $-\infty$  denote two distinct objects, neither of which is in  $\mathbf{R}$ .

Define an add and scalar multi on  $\mathbf{R} \cup \{\infty, -\infty\}$  as you could guess.

The operations of real numbers is as usual. While for  $t \in \mathbf{R}$  define

$$t\infty = \begin{cases} -\infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t > 0, \end{cases} \quad t(-\infty) = \begin{cases} -\infty & \text{if } t > 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t < 0, \end{cases}$$

$$\text{(I) } t + \infty = \infty + t = \infty + \infty = \infty,$$

$$\text{(II) } t + (-\infty) = (-\infty) + t = (-\infty) + (-\infty) = -\infty,$$

$$\text{(III) } \infty + (-\infty) = (-\infty) + \infty = 0.$$

With these operations of add and scalar multi, is  $\mathbf{R} \cup \{\infty, -\infty\}$  a vecsp over  $\mathbf{R}$ ? Explain.

SOLUTION:

Not a vecsp, since the add and scalar multi is not assoc and distr.

By Assoc:  $(a + \infty) + (-\infty) \neq a + (\infty + (-\infty))$ .

$$\text{OR. By Distr: } \infty = (2 + (-1))\infty \neq 2\infty + (-\infty) = \infty + (-\infty) = 0. \quad \square$$

**7** Give a nontrivial  $U \subseteq \mathbb{R}^2$ ,

$U$  is closed under taking add invs and under add, but is not a subsp of  $\mathbb{R}^2$ .

**SOLUTION:** Let  $U = \mathbb{Z}^2, (\mathbb{Z}^*)^2, (\mathbb{Q}^*)^2, \mathbb{Q}^2 \setminus \{0\}$ , or  $\mathbb{R}^2 \setminus \{0\}$ .

**8** Give a nontrivial  $U \subseteq \mathbb{R}^2$ ,  $U$  is closed under scalar multi, but is not a subsp of  $\mathbb{R}^2$ .

**SOLUTION:** Let  $U = \{(x, y) \in \mathbb{R}^2 : x = 0 \vee y = 0\}$ .

**9** A function  $f : \mathbb{R} \rightarrow \mathbb{R}$  is called periodic if  $\exists p \in \mathbb{N}^+, f(x) = f(x + p)$  for all  $x \in \mathbb{R}$ .  
Is the set of periodic functions  $\mathbb{R} \rightarrow \mathbb{R}$  a subsp of  $\mathbb{R}^{\mathbb{R}}$ ? Explain.

**SOLUTION:** Denote the set by  $S$ .

Suppose  $h(x) = \cos x + \sin \sqrt{2}x \in S$ , since  $\cos x, \sin \sqrt{2}x \in S$ .

Assume  $\exists p \in \mathbb{N}^+$  such that  $h(x) = h(x + p), \forall x \in \mathbb{R}$ . Let  $x = 0 \Rightarrow h(0) = h(\pm p) = 1$ .

Thus  $1 = \cos p + \sin \sqrt{2}p = \cos p - \sin \sqrt{2}p$

$\Rightarrow \sin \sqrt{2}p = 0, \cos p = 1 \Rightarrow p = 2k\pi, k \in \mathbb{Z}$ , while  $p = \frac{m\pi}{\sqrt{2}}, m \in \mathbb{Z}$ .

Hence  $2k = \frac{m}{\sqrt{2}} \Rightarrow \sqrt{2} = \frac{m}{2k} \in \mathbb{Q}$ . Contradiction! □

OR. Because [I] :  $\cos x + \sin \sqrt{2}x = \cos(x + p) + \sin(\sqrt{2}x + \sqrt{2}p)$ . By differentiating twice,

[II] :  $\cos x + 2 \sin \sqrt{2}x = \cos(x + p) + 2 \sin(\sqrt{2}x + \sqrt{2}p)$ .

$\left. \begin{array}{l} \text{[II]} - \text{[I]} : \sin \sqrt{2}x = \sin(\sqrt{2}x + \sqrt{2}p) \\ 2\text{[I]} - \text{[II]} : \cos x = \cos(x + p) \end{array} \right\} \Rightarrow \text{Let } x = 0, p = \frac{m\pi}{\sqrt{2}} = 2k\pi. \text{ Contradicts.}$  □

**18** Does the add on the subsp of  $V$  have an add identity? Which subsp have add invs?

**SOLUTION:** Suppose  $\Omega$  is the additive identity.

(a) For any subsp  $U$  of  $V$ .  $\Omega \subseteq U + \Omega = U \Rightarrow \Omega \subseteq U$ . Let  $U = \{0\}$ , then  $\Omega = \{0\}$ .

(b) Now suppose  $W$  is an add inv of  $U \Rightarrow U + W = \Omega$ .

Note that  $U + W \supseteq U, W \Rightarrow \Omega \supseteq U, W$ . Thus  $U = W = \Omega = \{0\}$ . □

**11** Prove that the intersection of every collection of subsp of  $V$  is a subsp of  $V$ .

**SOLUTION:** Suppose  $\{U_\alpha\}_{\alpha \in \Gamma}$  is a collection of subsp of  $V$ ; here  $\Gamma$  is an arbitrary index set.

We show that  $\bigcap_{\alpha \in \Gamma} U_\alpha$ , which equals the set of vecs that are in  $U_\alpha$  for each  $\alpha \in \Gamma$ , is a subsp of  $V$ .

(一)  $0 \in \bigcap_{\alpha \in \Gamma} U_\alpha$ . Nonempty.

(二)  $u, v \in \bigcap_{\alpha \in \Gamma} U_\alpha \Rightarrow u + v \in U_\alpha, \forall \alpha \in \Gamma \Rightarrow u + v \in \bigcap_{\alpha \in \Gamma} U_\alpha$ . Closed under add.

(三)  $u \in \bigcap_{\alpha \in \Gamma} U_\alpha, \lambda \in \mathbb{F} \Rightarrow \lambda u \in U_\alpha, \forall \alpha \in \Gamma \Rightarrow \lambda u \in \bigcap_{\alpha \in \Gamma} U_\alpha$ . Closed under scalar multi.

Thus  $\bigcap_{\alpha \in \Gamma} U_\alpha$  is nonempty subset of  $V$  that is closed under add and scalar multi. □

**12** Suppose  $U, W$  are subsp of  $V$ . Prove that  $U \cup W$  is a subsp of  $V \iff U \subseteq W$  or  $W \subseteq U$ .

**SOLUTION:**

(a) Suppose  $U \subseteq W$ . Then  $U \cup W = W$  is a subsp of  $V$ .

(b) Suppose  $U \cup W$  is a subsp of  $V$ . Suppose  $U \not\subseteq W$  and  $U \not\supseteq W$  ( $U \cup W \neq U$  and  $W$ ).

Then  $\forall a \in U \wedge a \notin W, b \in W \wedge b \notin U, a + b \in U \cup W$ .

$\left. \begin{array}{l} \text{If } a + b \in U \Rightarrow b = (a + b) + (-a) \in U, \text{ contradicts!} \\ \text{If } a + b \in W \Rightarrow a = (a + b) + (-b) \in W, \text{ contradicts!} \end{array} \right\} \Rightarrow U \cup W = U \text{ or } W. \text{ Contradicts!}$

Thus  $U \subseteq W$  and  $U \supseteq W$ . □

**13** Prove that the union of three subsp of  $V$  is a subsp of  $V$  if and only if one of the subsp contains the other two.

*This exercise is not true if we replace  $\mathbf{F}$  with a field containing only two elements.*

**SOLUTION:**

Suppose  $U_1, U_2, U_3$  are subsp of  $V$ . Denote  $U_1 \cup U_2 \cup U_3$  by  $\mathcal{U}$ .

(a) Suppose that one of the subsp contains the other two.

Then  $\mathcal{U} = U_1, U_2$  or  $U_3$  is a subsp of  $V$ .

(b) Suppose that  $U_1 \cup U_2 \cup U_3$  is a subsp of  $V$ .

Distinctively notice that  $A \cup B \cup C = (A \cup B) \cup (B \cup C) = (A \cup C) \cup (B \cup C) = (A \cup B) \cup (A \cup C)$ .

Also note that, if  $U \cup W = V$  is a vecsp, then in general  $U$  and  $W$  are not subsp of  $V$ .

Hence this literal trick is invalid.

(I) If any  $U_j$  is contained in the union of the other two, say  $U_1 \subseteq U_2 \cup U_3$ , then  $\mathcal{U} = U_2 \cup U_3$ .

By applying Problem (12) we conclude that one  $U_j$  contains the other two. Thus we are done.

(II) Assume that no  $U_j$  is contained in the union of the other two,

and no  $U_j$  contains the union of the other two.

Say  $U_1 \not\subseteq U_2 \cup U_3$  and  $U_1 \not\supseteq U_2 \cup U_3$ .

$\exists u \in U_1 \wedge u \notin U_2 \cup U_3; v \in U_2 \cup U_3 \wedge v \notin U_1$ . Let  $W = \{v + \lambda u : \lambda \in \mathbf{F}\} \subseteq \mathcal{U}$ .

Note that  $W \cap U_1 = \emptyset$ , for if  $v + \lambda u \in U_1$  then  $v + \lambda u - \lambda u = v \in U_1$ .

又  $W \subseteq U_1 \cup U_2 \cup U_3$ . Thus  $W \subseteq U_2 \cup U_3$ .

$\forall v + \lambda u \in W, \exists i \in \{2, 3\}, v + \lambda u \in U_i$ .

Because  $U_2, U_3$  are subsp and hence have at least one element.

If  $U_2 = U_3$ , then  $\mathcal{U} = U_1 \cup U_2$  and by Problem (12) we are done.

Otherwise,  $\exists$  distinct  $\lambda, \mu \in \mathbf{F}, v + \lambda u, v + \mu u \in U_i$  for some  $i \in \{2, 3\}$ .

Then  $u \in U_i$  while  $u \notin U_2 \cup U_3$ . Contradicts. □

• **EXAMPLE:** Suppose  $U = \{(x, x, y, y) \in \mathbf{F}^4\}, W = \{(x, x, x, y) \in \mathbf{F}^4\}$ .

Let  $T$  denote  $\{(x, x, y, z) \in \mathbf{F}^4 : x, y, z \in \mathbf{F}\}$ . By def,  $U + W \subseteq T$ .

And  $T \ni (x, x, y, z) \Rightarrow (0, 0, y - x, y - x) + (x, x, x, -y + x + z) \in U + W$ . Hence  $T \subseteq U + W$ . □

And  $\mathbf{F}^5 \ni (x, y, z, w, u) \Rightarrow (x, y, x + y, x - y, 2x) + (0, 0, z - x - y, w - x - y, u - 2x) \in U + W$ .  $\square$

**23** Give an example of vecsps  $V_1, V_2, U$  such that  $V_1 \oplus U = V_2 \oplus U$ , but  $V_1 \neq V_2$ .

**SOLUTION:**  $V = \mathbf{F}^2, U = \{(x, x) \in \mathbf{F}^2\}, V_1 = \{(x, 0) \in \mathbf{F}^2\}, V_2 = \{(0, x) \in \mathbf{F}^2\}$ .

**22** Suppose  $U = \{(x, y, x + y, x - y, 2x) \in \mathbf{F}^5\}$ .

Find nonzero subsp  $W_1, W_2, W_3$  of  $\mathbf{F}^5$  such that  $\mathbf{F}^5 = U \oplus W_1 \oplus W_2 \oplus W_3$ .

**SOLUTION:**

(1) Let  $W_1 = \{(0, 0, z, 0, 0) \in \mathbf{F}^5\} \Rightarrow W_1 \cap U = \{0\}$ . Now  $U \oplus W_1 = \{(x, y, z, x - y, 2x) \in \mathbf{F}^5\} = U_1$ .

(2) Let  $W_2 = \{(0, 0, 0, w, 0) \in \mathbf{F}^5\} \Rightarrow W_2 \cap U_1 = \{0\}$ . Now  $U_1 \oplus W_2 = \{(x, y, z, w, 2x) \in \mathbf{F}^5\} = U_2$ .

(3) Let  $W_3 = \{(0, 0, 0, 0, u) \in \mathbf{F}^5\} \Rightarrow W_3 \cap U_2 = \{0\}$ . Now  $U_2 \oplus W_3 = \{(x, y, z, w, u) \in \mathbf{F}^5\} = U_3$ .

Thus  $\mathbf{F}^5 = ((U \oplus W_1) \oplus W_2) \oplus W_3$ .  $\square$

**SOLUTION:**

$P \Rightarrow Q$  : Suppose  $V$  is infinite-dim, so that no list spans  $V$ .

Step 1 Pick a  $v_1 \neq 0, (v_1)$  linely inde.

Step  $m$  Pick a  $v_m \notin \text{span}(v_1, \dots, v_{m-1})$ , by Problem (10)(b),  $(v_1, \dots, v_m)$  is linely inde.

This process recursively defines the desired sequence  $(v_1, v_2, \dots)$ .

$\neg P \Rightarrow \neg Q$  : Suppose  $V$  is finite-dim and  $V = \text{span}(w_1, \dots, w_m)$ .

Let  $(v_1, v_2, \dots)$  be a sequence in  $V$ , then  $(v_1, v_2, \dots, v_{m+1})$  must be linely dep.

OR.  $Q \Rightarrow P$  : Suppose there is such a sequence.

Choose an  $m \in \mathbf{N}^+$ . Suppose  $a_0, \dots, a_m \in \mathbf{R}$  are such that  $a_0 + a_1x + \dots + a_mx^m = 0, \forall x \in [0, 1]$ .

Then the poly has infinitely many roots and hence  $a_0 = \dots = a_m = 0$ .

Thus  $(1, x, \dots, x^m)$  is linely inde in  $\mathbf{R}^{[0,1]}$ . Similar to [2.16],  $U$  is infinite-dim. □

OR. Note that for  $a_n = \frac{1}{n}, a_1 < a_2 < \dots < a_m, \forall m \in \mathbf{N}^+$ .

Prove that  $(p_0, p_1, \dots, p_m)$  is not linely inde in  $\mathcal{P}_m(\mathbf{F})$ .

**SOLUTION:**

Suppose  $(p_0, p_1, \dots, p_m)$  is linely inde. Define  $p \in \mathcal{P}_m(\mathbf{F})$  by  $p(z) = z \forall z \in \mathbf{F}$ .

But  $\forall a_i \in \mathbf{F}, z \neq a_0p_0(z) + \dots + a_mp_m(z)$ , for if not, let  $z = 2$ , contradicts. Thus  $z \notin \text{span}(p_0, p_1, \dots, p_m)$ .

Then  $\text{span}(p_0, p_1, \dots, p_m) \subsetneq \mathcal{P}_m(\mathbf{F})$  while the list  $(p_0, p_1, \dots, p_m)$  has length  $(m+1)$ .

Hence  $(p_0, p_1, \dots, p_m)$  is linely depe in  $\mathcal{P}_m(\mathbf{F})$ .

For if not, because  $(1, z, \dots, z^m)$  of length  $(m+1)$  spans  $\mathcal{P}_m(\mathbf{F})$ ,

thus by [2.23] trivially,  $(p_0, p_1, \dots, p_m)$  spans  $\mathcal{P}_m(\mathbf{F})$ . Contradicts. □

( See the above ) Now  $z \notin \text{span}(p_0, p_1, \dots, p_m)$  and hence  $(p_0, p_1, \dots, p_m)$  is linely dep. □

SOLUTION: A counterexample:

Let  $V = \mathbb{R}^4$  and  $e_j$  be the  $j^{\text{th}}$  standard basis.

Let  $v_1 = e_1, v_2 = e_2, v_3 = e_3 + e_4, v_4 = e_4$ . Then  $(v_1, \dots, v_4)$  is a basis of  $\mathbb{R}^4$ .

Let  $U = \text{span}(e_1, e_2, e_3) = \text{span}(v_1, v_2, v_3 - v_4)$ . Then  $v_3 \notin U$  and  $(v_1, v_2)$  is not a basis of  $U$ .  $\square$

### 1 Find all vecsps that have exactly one basis.

SOLUTION: The trivial vecsp  $\{0\}$  will do. Indeed, the only basis of  $\{0\}$  is the empty list.

Now consider a field containing only the add identity 0 and the multi identity 1,

and we specify that  $1 + 1 = 0$ . Hence the vecsp  $\{0, 1\}$  will do, the list (1) will be the unique basis.

Are there other vecsps? Suppose so.

(I) Consider  $\mathbb{F} = \mathbb{R}$  or  $\mathbb{C}$ . Let  $(v_1, \dots, v_m)$  be a basis of  $V \neq \{0\}$ .

While there are infinitely many bases distinct from this one. Hence we fail.

(II) Consider other  $\mathbb{F}$ . Note that a field contains at least 0 and 1

• **NOTE FOR linely inde sequence and [2.34]:**

“ $V = \text{span}(v_1, \dots, v_n, \dots)$ ” is an invalid expression.

If we allow using “infinite list”, then we must guarantee that  $(v_1, \dots, v_n, \dots)$  is a spanning “list” such that for all  $v \in V$ , there exists a smallest positive integer  $n$  such that  $v = a_1v_1 + \dots + a_nv_n$ .

The key point is, how can we guarantee that such a “list” exists?

Prove that  $\exists (n-m)$  subsp  $U_1, \dots, U_{n-m}$ , each of dim  $(n-1)$ , such that  $\bigcap_{i=1}^{n-m} U_i = U$ .

**SOLUTION:**

Let  $(v_1, \dots, v_m)$  be a basis of  $U$ , extend to a basis of  $V$  as  $(v_1, \dots, v_m, u_1, \dots, u_{n-m})$ .

[Similar to] Given three sets  $A, B$  and  $C$ .

Because  $|X + Y| = |X| + |Y| - |X \cap Y|$ ;  $(X \cup Y) \cap Z = (X \cap Z) \cup (Y \cap Z)$ .

Now  $|A \cup B \cup C| = |A \cup B| + |C| - |(A \cup B) \cap C|$ .

And  $|(A \cup B) \cap C| = |(A \cap C) \cup (B \cap C)| = |A \cap C| + |B \cap C| - |A \cap B \cap C|$ .

Prove that  $\exists B_W = (w_1, \dots, w_m)$  such that  $w = w_1 + \dots + w_m$ .

[Proof]

By Problem (15),  $\exists$  one-dim subsp $s$   $W_1, \dots, W_m$  of  $W$  such that  $W = W_1 \oplus \dots \oplus W_m$ .

Note that  $\dim W_i = \dim \text{span}(w_i) = 1 \Rightarrow \forall x_i \in W_i, \exists! c_i \in \mathbb{F}, x_i = c_i w_i$ .

Suppose  $w = x_1 + \dots + x_m$ , where each  $x_i = c_i w_i \in W_i$ . Then  $(x_1, \dots, x_m)$  is also a basis of  $W$ .  $\square$

OR. Note that  $w \neq 0 \Rightarrow m \geq 1$ . If  $m = 1$  then let  $w_1 = w$  and we are done. Suppose  $m > 1$ .

Extend  $(w)$  to a basis  $(w, w_1, \dots, w_{m-1})$  of  $W$ . Let  $w_m = w - w_1 - \dots - w_{m-1}$ .

$\text{span}(w, w_1, \dots, w_{m-1}) = \text{span}(w_1, \dots, w_m)$ . Hence  $(w_1, \dots, w_m)$  is also a basis of  $W$ .  $\square$

• **NEW THEOREM:** Suppose  $V$  is finite-dim with  $\dim V = n$  and  $U$  is a subsp of  $V$  with  $U \neq V$ .

Prove that  $\exists B_V = (v_1, \dots, v_n)$  such that each  $v_k \notin U$ .

Note that  $U \neq V \Rightarrow n \geq 1$ . We will construct  $B_V$  via the following process.

**Step 1.**  $\exists v_1 \in V \setminus U \Rightarrow v_1 \neq 0$ . If  $\text{span}(v_1) = V$  then we stop.

**Step k.** Suppose  $(v_1, \dots, v_{k-1})$  is linely inde in  $V$ , each of which belongs to  $V \setminus U$ .

Note that  $\text{span}(v_1, \dots, v_{k-1}) \neq V$ . And if  $\text{span}(v_1, \dots, v_{k-1}) \cup U = V$ , then by (1.C.12),

( because  $\text{span}(v_1, \dots, v_{k-1}) \not\subseteq U$ , )  $U \subseteq \text{span}(v_1, \dots, v_{k-1}) \Rightarrow \text{span}(v_1, \dots, v_{k-1}) = V$ .

Hence because  $\text{span}(v_1, \dots, v_{k-1}) \neq V$ , it must be case that  $\text{span}(v_1, \dots, v_{k-1}) \cup U \neq V$ .

Thus  $\exists v_k \in V \setminus U$  such that  $v_k \notin \text{span}(v_1, \dots, v_{k-1})$ .

By (2.A.11),  $(v_1, \dots, v_k)$  is linely inde in  $V$ . If  $\text{span}(v_1, \dots, v_k) = V$ , then we stop.

Because  $V$  is finite-dim, this process will stop after  $n$  steps.  $\square$

OR. If  $U = \{0\}$  then we are done. Suppose  $\dim U \geq 1$ .

Let  $(u_1, \dots, u_m)$  be a basis of  $U$ , extend to a basis  $(u_1, \dots, u_n)$  of  $V$ .

Then let  $B_V = (u_1 - u_k, \dots, u_m - u_k, u_{m+1}, \dots, u_k, \dots, u_n)$ .  $\square$

Assume that  $(v, Tv)$  is linely depe for every  $v \in V$ , then by (2.A.2.(b)),  $Tv = \lambda_v v$  for some  $\lambda_v \in \mathbb{F}$ .

To prove that  $\lambda_v$  is independent of  $v$

( in other words, for any two distinct  $v, w$  in  $V \setminus \{0\}$ , we have  $\lambda_v \neq \lambda_w$  ), we discuss in two cases:

$$\left. \begin{array}{l} (-) \text{ If } (v, w) \text{ is linely inde, } \lambda_{v+w}(v+w) = T(v+w) = Tv + Tw = a_v v + a_w w \\ \quad \Rightarrow (\lambda_{v+w} - \lambda_v)v + (\lambda_{v+w} - \lambda_w)w = 0 \\ (=) \text{ Otherwise, suppose } w = cv, a_w w = Tw = cTv = ca_v v = a_v w \Rightarrow (a_w - a_v)w = 0 \end{array} \right\} \Rightarrow a_w = a_v.$$

Hence  $\forall T \in \mathcal{L}(V), I \circ T = T \circ I = T \in \mathcal{E} \Rightarrow \mathcal{E} = \mathcal{L}(V)$ . Now we prove the assumption.

**26** Prove that the differentiation map  $D \in \mathcal{P}(\mathbf{R})$  is surj.

**SOLUTION:**

[Informal Proof]  $\left| \begin{array}{l} \text{Note that } \deg Dx^n = n - 1. \text{ Because } \text{span}(Dx, Dx^2, \dots) \subseteq \text{range } D. \\ \text{又 By (2.C.10), } \text{span}(Dx, Dx^2, \dots) = \text{span}(1, x, \dots) = \mathcal{P}(\mathbf{R}). \end{array} \right.$

[Proper Proof]

We will recursively define a sequence of polynomials  $(p_k)_{k=0}^{\infty}$  where  $Dp_k = x^k$ .

(i) Because  $\dim Dx = (\deg x) - 1 = 0$ , we have  $Dx = C \in \mathbf{F}$ .

Define  $p_0 = C^{-1}x$ . Then  $Dp_0 = C^{-1}Dx = 1$ .

(ii) Suppose we have defined  $p_0, \dots, p_n$  such that  $Dp_k = x^k$  for each  $k \in \{0, \dots, n\}$ .

Because  $\deg D(x^{n+2}) = n + 1$ ,

Let  $D(x^{n+2}) = a_{n+1}x^{n+1} + a_nx^n + \dots + a_1x + a_0$ , where  $a_{n+1} \neq 0$ .

Then  $a_{n+1}^{-1}D(x^{n+2}) = x^{n+1} + a_{n+1}^{-1}(a_nDp_n + \dots + a_1Dp_1 + a_0Dp_0)$

$\Rightarrow x^{n+1} = D(a_{n+1}^{-1}(x^{n+2} - a_n p_n - \dots - a_1 p_1 - a_0 p_0))$ .

Thus defining  $p_{n+1} = a_{n+1}^{-1}(x^{n+2} - a_n p_n - \dots - a_1 p_1 - a_0 p_0)$ , we have  $Dp_{n+1} = x^{n+1}$ .

Now we get  $(p_k)_{k=0}^{\infty}$  by recursion. Hence  $\forall p = \sum_{k=0}^{\deg p} a_k x^k \in \mathcal{P}(\mathbf{R}), \exists q = (\sum_{k=0}^{\deg p} a_k p_k), Dq = p$ . □

Note that  $\deg Bx^n = n - 1$ . Similar to Problem (26), we conclude that  $B$  is surj. □

**SOLUTION:**

Suppose  $v_1, \dots, v_m \in V$  such that  $Tv_i = w_i$  for each  $v_i$ . Then  $(v_1, \dots, v_m)$  is linely inde.

Define  $\varphi_i : V \rightarrow \mathbf{F}$  by  $\varphi_i(v) = a_i v_i$  for each  $i$ . We now check the linearity.

$\forall v, u \in V (\exists ! a_i, b_i, c_i, d_i \in \mathbf{F}), \lambda \in \mathbf{F}, \varphi_i(v + \lambda u) = a_i + \lambda c_i = \varphi(v) + \lambda \varphi(u)$ . □

**SOLUTION:** If  $\varphi = 0$  then we are done. Suppose  $\varphi \neq 0$ .

(a)  $\forall v = cu \in \text{null } \varphi \cap \{au : a \in \mathbf{F}\}, \varphi(v) = 0 = c\varphi(u) \Rightarrow c = 0$ . Hence  $\text{null } \varphi \cap \{au : a \in \mathbf{F}\} = \{0\}$ .

(b)  $\forall v \in V, v = (v - \frac{\varphi(v)}{\varphi(u)}u) + \frac{\varphi(v)}{\varphi(u)}u. \left\{ \begin{array}{l} v - \frac{\varphi(v)}{\varphi(u)}u \in \text{null } \varphi \\ \frac{\varphi(v)}{\varphi(u)}u \in \{au : a \in \mathbf{F}\} \end{array} \right\} \Rightarrow V = \text{null } \varphi \oplus \{au : a \in \mathbf{F}\}. \quad \square$

**COMMENT:**  $\varphi \neq 0 \Rightarrow \varphi(v_i) = a_i \neq 0$  for each  $v_i$ , for some linely inde list  $(v_1, \dots, v_k)$ .

Fix one  $v_k$ . Then  $\forall j \in \{1, \dots, k-1, k+1, \dots, n\}, \text{span}\{a_j v_k - a_k v_j\} \subseteq \text{null } \varphi$ .

**SOLUTION:** Using notations in (4E 3.A.16).

Suppose  $\varphi \neq 0 \Rightarrow \exists i, j \in \{1, \dots, n\}, \varphi(R_{i,j}) \neq 0$ .

Again, because  $R_{i,x} = R_{y,x} \circ R_{i,y}, \forall y = 1, \dots, n$ . Thus  $\varphi(R_{y,x}) \neq 0, \forall x, y = 1, \dots, n$ .

Let  $l \neq i, k \neq j$  and then  $\varphi(R_{l,k} \circ R_{i,j}) = \varphi(0) = 0 = \varphi(R_{l,k}) \cdot \varphi(R_{i,j})$

$\Rightarrow \varphi(R_{l,k}) = 0$  or  $\varphi(R_{i,j}) = 0$ . Contradicts.  $\square$

OR. Note that by (4E 3.A.16),  $\exists S, T \in \mathcal{L}(V), ST - TS \neq 0$ .

Then  $\varphi(ST - TS) = \varphi(S)\varphi(T) - \varphi(T)\varphi(S) = 0 \Rightarrow ST - TS \in \text{null } \varphi \neq \{0\}$ .

Note that  $\forall E \in \text{null } \varphi, T \in \mathcal{L}(V), \varphi(ET) = \varphi(TE) = 0 \Rightarrow ET, TE \in \text{null } \varphi$ .

(d) The rows of  $\mathcal{M}(T)$  span  $\mathbb{F}^{1,n}$ .

(e) The rows of  $\mathcal{M}(T)$  are linely inde in  $\mathbb{F}^{1,n}$ .

SOLUTION: Using TIPS in 2.C.

$$T \text{ is inje} \iff \dim V = \dim \text{range } T + \dim \text{null } T = \dim \text{range } T$$

$$\Delta \left\{ \begin{array}{l} \iff (Tu_1, \dots, Tu_n) \text{ is a basis of } V; \dim \text{range } T = \dim \text{span}(\mathcal{M}(Tu_1), \dots, \mathcal{M}(Tu_n)) = n \\ \iff (\mathcal{M}(Tu_1), \dots, \mathcal{M}(Tu_n)) \text{ is a basis of } \mathbb{F}^{n,1}, \text{ as well as } (A_{\cdot,1}, \dots, A_{\cdot,n}) \end{array} \right.$$

$$\left[ \text{又 } \dim S_c = \dim \text{span}(A_{\cdot,1}, \dots, A_{\cdot,n}) = \dim \text{span}(A_{1,\cdot}, \dots, A_{n,\cdot}) = \dim S_r = n \right]$$

$$\iff (A_{1,\cdot}, \dots, A_{n,\cdot}) \text{ is a basis of } \mathbb{F}^{1,n}.$$

□

Now we show that  $(\Delta)$  properly.

(a)  $\Rightarrow$  (b) :

$$\text{Suppose } b_1 A_{\cdot,1} + \cdots + b_n A_{\cdot,n} = \begin{pmatrix} b_1 A_{1,1} + \cdots + b_n A_{1,n} \\ \vdots \\ b_1 A_{n,1} + \cdots + b_n A_{n,n} \end{pmatrix} = 0. \text{ Let } u = b_1 u_1 + \cdots + b_n u_n.$$

$$\text{Then } Tu = b_1 Tu_1 + \cdots + b_n Tu_n$$

$$= b_1 (A_{1,1}v_1 + \cdots + A_{n,1}v_n) + \cdots + b_n (A_{1,n}v_1 + \cdots + A_{n,n}v_n)$$

$$= (b_1 A_{1,1} + \cdots + b_n A_{1,n})v_1 + \cdots + (b_1 A_{n,1} + \cdots + b_n A_{n,n})v_n$$

$$= 0v_1 + \cdots + 0v_n = 0$$

$$\Rightarrow b_1 = \cdots = b_n = 0.$$

Thus by (2.39), (b) holds.

(b)  $\Rightarrow$  (a) :

$$\text{Which is equivalent to } \begin{pmatrix} b_1 A_{1,1} + \cdots + b_n A_{1,n} \\ \vdots \\ b_1 A_{n,1} + \cdots + b_n A_{n,n} \end{pmatrix} = b_1 A_{\cdot,1} + \cdots + b_n A_{\cdot,n} = 0 \Rightarrow b_1 = \cdots = b_n = 0.$$

OR. Conversely, denote  $\mathcal{M}(T, B_V)$  by  $A$ , where  $B_V = (u_1, \dots, u_m)$  is arbitrary.

Fix one  $B_V = (v_1, \dots, v_m)$  and then  $(v_1, \dots, \frac{1}{2}v_k, \dots, v_m)$  is also a basis for any given  $k \in \{1, \dots, m\}$ .

Fix one  $k$ . Now we have  $T(\frac{1}{2}v_k) = A_{1,k}v_1 + \dots + A_{k,k}(\frac{1}{2}v_k) + \dots + A_{m,k}v_m$

$$\Rightarrow Tv_k = 2A_{1,k}v_1 + \dots + A_{k,k}v_k + \dots + 2A_{m,k}v_m = A_{1,k}v_1 + \dots + A_{k,k}v_k + \dots + A_{m,k}v_m.$$

Then  $A_{j,k} = 2A_{j,k} \Rightarrow A_{j,k} = 0$  for all  $j \neq k$ . Thus  $Tv_k = A_{k,k}v_k, \forall k \in \{1, \dots, m\}$ .

Now we show that  $A_{k,k} = A_{j,j}$  for all  $j \neq k$ . Choose  $j, k$  such that  $j \neq k$ .

Consider the basis  $B'_V = (v'_1, \dots, v'_j, \dots, v'_k, \dots, v'_m)$ ,

where  $v'_j = v_k, v'_k = v_j$  and  $v'_i = v_i$  for all  $i \in \{1, \dots, m\} \setminus \{j, k\}$ .

Remember that  $\mathcal{M}(T, B'_V) = \mathcal{M}(T, B_V) = A$ .

Hence  $T(v'_k) = A_{1,k}v'_1 + \dots + A_{k,k}v'_k + \dots + A_{m,k}v'_m = A_{k,k}v'_k = A_{k,k}v_j$ , while  $T(v'_k) = T(v_j) = A_{j,j}v_j$ .

Thus  $A_{k,k} = A_{j,j}$ . □

• **NOTE FOR [3.60]:** Suppose  $B_V = (v_1, \dots, v_n)$ ,  $B_W = (w_1, \dots, w_m)$ .

Define  $E_{i,j} \in \mathcal{L}(V, W)$  by  $E_{i,j}(v_x) = \delta_{i,x} w_j$ ; See (3.A.12). **COROLLARY:**  $E_{l,k} E_{i,j} = \delta_{j,l} E_{i,k}$ .

Denote  $\mathcal{M}(E_{i,j})$  by  $\mathcal{E}^{(j,i)}$ . And  $(\mathcal{E}^{(j,i)})_{l,k} = \begin{cases} 0, & i \neq k \vee j \neq l \\ 1, & i = k \wedge j = l \end{cases}$

Because  $\mathcal{L}(V, W)$  and  $\mathbf{F}^{m,n}$  are iso. And  $T = \mathcal{M}^{-1} \mathcal{M}(T)$ ;  $E_{i,j} = \mathcal{M}^{-1} \mathcal{E}^{(j,i)}$ .

Hence  $\forall T \in \mathcal{L}(V, W)$ ,  $\exists! A_{i,j} \in \mathbf{F} \left( \forall i \in \{1, \dots, m\}, j \in \{1, \dots, n\} \right)$ ,  $\mathcal{M}(T) = A = \begin{pmatrix} A_{1,1} & \dots & A_{1,n} \\ \vdots & \ddots & \vdots \\ A_{m,1} & \dots & A_{m,n} \end{pmatrix}$ .

$$\text{Thus } A = \begin{pmatrix} A_{1,1} \mathcal{E}^{(1,1)} + & \dots & + A_{1,n} \mathcal{E}^{(1,n)} \\ + & \dots & + \\ \vdots & \ddots & \vdots \\ + & \dots & + \\ A_{m,1} \mathcal{E}^{(m,1)} + & \dots & + A_{m,n} \mathcal{E}^{(m,n)} \end{pmatrix} \iff \begin{pmatrix} A_{1,1} E_{1,1} + & \dots & + A_{1,n} E_{n,1} \\ + & \dots & + \\ \vdots & \ddots & \vdots \\ + & \dots & + \\ A_{m,1} E_{1,m} + & \dots & + A_{m,n} E_{n,m} \end{pmatrix} = T.$$

$$\therefore \mathcal{L}(V, W) = \text{span} \underbrace{\begin{pmatrix} E_{1,1}, & \dots, & E_{n,1}, \\ \vdots & \ddots & \vdots \\ E_{1,m}, & \dots, & E_{n,m} \end{pmatrix}}_B; \quad \mathbf{F}^{m,n} = \text{span} \underbrace{\begin{pmatrix} \mathcal{E}^{(1,1)}, & \dots, & \mathcal{E}^{(1,n)}, \\ \vdots & \ddots & \vdots \\ \mathcal{E}^{(m,1)}, & \dots, & \mathcal{E}^{(m,n)} \end{pmatrix}}_{B_{\mathcal{M}}}.$$

Hence by [2.42] and [3.61], we conclude that  $B$  is a basis of  $\mathcal{L}(V, W)$  and that  $B_{\mathcal{M}}$  is a basis of  $\mathbf{F}^{m,n}$ .

**SOLUTION:**

(a)  $\forall S, T \in \mathcal{E}, \lambda \in \mathbf{F}, \forall u \in U, Su = \lambda Tu = (S + \lambda T)u = 0 \Rightarrow (S + \lambda T) \in \mathcal{E}$ .

(b) Define  $\Phi$  as in the hint.

Because  $T \in \text{null } \Phi \iff \Phi(T) = 0 \iff \forall u \in U, Tu = 0 \iff T \in \mathcal{E}$ .

Hence  $\text{null } \Phi = \mathcal{E}$ .

Because  $S \in \mathcal{L}(U, W) \Rightarrow \exists T \in \mathcal{L}(V, W), \Phi(T) = S$ , by (3.A.11)  $\Rightarrow S \in \text{range } \Phi$ .

Hence  $\text{range } \Phi = \mathcal{L}(U, W)$ .

Thus  $\dim \text{null } \Phi = \dim \mathcal{E} = \dim \mathcal{L}(V, W) - \dim \text{range } \Phi = (\dim V - \dim U) \dim W$ . □

For each  $r \in \mathbf{N}^+$ , let  $e_r[p] = \begin{cases} 1, & (p-1) \equiv 0 \pmod{r} \\ 0, & \text{otherwise} \end{cases}$  | simply  $e_r = (1, \underbrace{0, \dots, 0}_{(p-1) \text{ times}}, 1, \underbrace{0, \dots, 0}_{(p-1) \text{ times}}, 1, \dots)$ .

Choose one  $m \in \mathbf{N}^+$ . Let  $a_1(e_1 + U) + \dots + a_m(e_m + U) = 0 + U \Rightarrow \exists u \in U, a_1e_1 + \dots + a_me_m = u$ .

Suppose  $u = (x_1, \dots, x_L, 0, \dots)$ , where  $L$  is the largest such that  $u[L] \neq 0$ .

Let  $s \in \mathbf{N}^+$  be such that  $h = s \cdot m! + 1 > L$  and  $e_1[h] = \dots = e_m[h] = 1$ .

Note that by definition,  $e_r[s \cot m! + 1 + p] = e_r[p + 1] = 1 \iff p \equiv 0 \pmod{r} \iff r | p$ .

Now for any  $p \in \{1, \dots, m\}$ ,  $u[h + p] = \left( \sum_{r=1}^m a_r e_r \right)[p + 1] = \sum_{k=1}^{\tau(p)} a_{p_k} = 0$  (Δ)

where  $1 = p_1 \leq \dots \leq p_{\tau(p)} = p$  are all the distinct factors of  $p$ .

Let  $q = p_{\tau(p)-1}$ . Notice that  $\tau(q) = \tau(p) - 1$  and  $q_k = p_k, \forall k \in \{1, \dots, \tau(q)\}$ .

Again by (Δ),  $\left( \sum_{r=1}^m a_r e_r \right)[h + q] = \sum_{k=1}^{\tau(p)-1} a_{p_k} = 0$ . Thus  $a_{p_{\tau(p)}} = a_p = 0$  for any  $p \in \{1, \dots, m\}$ .

Hence  $\forall m \in \mathbf{N}^+$ ,  $(e_1, \dots, e_m)$  is linearly inde in  $\mathbf{F}^\infty$ , so is  $(e_1 + U, \dots, e_m + U)$  in  $\mathbf{F}^\infty/U$ . By (2.A.14).  $\square$

OR. For each  $r \in \mathbf{N}^+$ , let  $e_r[p] = \begin{cases} 1, & \text{if } 2^r | p \\ 0, & \text{otherwise} \end{cases}$ .

Similarly, let  $m \in \mathbf{N}^+$  and  $a_1(e_1 + U) + \dots + a_m(e_m + U) = 0 \Rightarrow a_1e_1 + \dots + a_me_m = u \in U$ .

Suppose  $L$  is the largest such that  $u[L] \neq 0$ . And  $l$  is such that  $2^{ml} > L$ .

Then  $\forall k \in \{1, \dots, m\}, u[2^{ml} + 2^k] = \left( \sum_{r=1}^m a_r e_r \right)[2^k] = a_1 + \dots + a_k = 0$ .

Thus  $a_1 = \dots = a_m = 0$  and  $(e_1, \dots, e_m)$  is linearly inde. Similarly.  $\square$

Thus  $\pm(v - x) \in U \cap W \Rightarrow \begin{cases} u_1 = (x - v) + w_1 \in W \Rightarrow U \subseteq W \\ w_2 = (v - x) + u_2 \in U \Rightarrow W \subseteq U \end{cases} \Rightarrow U = W$ .  $\square$

**SOLUTION:**

If  $c \in W$  but  $c \notin \text{range } T$ , then  $U = \emptyset$ , we are done. Now suppose  $c \in \text{range } T$  and  $x \in U$ .

$\forall x + y \in x + \text{null } T$  ( $\forall y \in \text{null } T$ ),  $x + y \in U$ . Hence  $x + \text{null } T \subseteq U$ .

$\forall u \in U, u - x \in \text{null } T \Rightarrow u = x + (u - x) \in x + \text{null } T$ . Hence  $U \subseteq x + \text{null } T$ .  $\square$

**SOLUTION:**

Suppose  $A = a + U$ . Then  $\forall a + u_1, a + u_2 \in A, \lambda \in \mathbb{F}$ ,

Suppose  $\lambda v + (1 - \lambda)w \in A, \forall v, w \in A, \lambda \in \mathbb{F}$ . Suppose  $a \in A$  and let  $A' = \{x - a : x \in A\}$ .

Then  $0 \in A'$  and  $\forall x - a, y - a \in A', (\forall x, y \in A), \lambda \in \mathbb{F}$ ,

(I)  $\lambda(x - a) = [\lambda x + (1 - \lambda)a] - a \in A'$ .

(II)  $\lambda(x - a) + (1 - \lambda)(y - a) = \frac{1}{2}(x - a) + \frac{1}{2}(y - a) = \frac{1}{2}x + (1 - \frac{1}{2})y - a \in A'$ .

OR. By (I),  $2 \times [\frac{1}{2}(x - a) + \frac{1}{2}(y - a)] = (x - a) + (y - a) \in A'$ .

Thus  $A'$  is a subsp of  $V$ . Hence  $a + A' = \{(x - a) + a : x \in A\} = A$  is a translate.  $\square$

(I)  $(x - \frac{1}{2}a) + (y - \frac{1}{2}a) = x + y - a \in A \Rightarrow x + y - 2a = (x - a) + (y - a) \in A'$ .

(II)  $\lambda(x - a) = (\lambda x + (1 - \lambda)a) - a \in A'$ .

**SOLUTION:** By [3.111],  $T$  is linear. Note that  $(A^t)^t = A$ .

(a) For any  $B \in \mathbf{F}^{n,m}$ , let  $A = B^t$  so that  $T(A) = B$ . Thus  $T$  is surj.

(b) If  $T(A) = 0$  for some  $A \in \mathbf{F}^{n,m}$ , then  $A = 0$ . Thus  $T$  is inje,

for if not,  $\exists j, k \in \mathbf{N}^+$  such that  $A_{j,k} \neq 0$ , then  $T(A)_{k,j} \neq 0$ , contradicts.  $\square$

**32** Suppose  $T \in \mathcal{L}(V)$ , and  $(u_1, \dots, u_m), (v_1, \dots, v_m)$  are bases of  $V$ . Prove that

$T$  is inv  $\iff$  the rows of  $\mathcal{M}(T, (u_1, \dots, u_m), (v_1, \dots, v_m))$  form a basis of  $\mathbf{F}^{1,n}$ .

**SOLUTION:** Note that  $T$  is invertible  $\iff T'$  is inv. And  $\mathcal{M}(T') = \mathcal{M}(T)^t = A^t$ , denote it by  $B$ .

Let  $(\varphi_1, \dots, \varphi_m)$  be the dual basis of  $v_1, \dots, v_m$ ,  $(\psi_1, \dots, \psi_m)$  be the dual basis of  $(u_1, \dots, u_m)$ .

(a) Suppose  $T$  is inv, so is  $T'$ . Because  $T'(\varphi_1), \dots, T'(\varphi_m)$  is linely inde.

Noticing that  $T'(\varphi_i) = B_{1,i}\psi_1 + \dots + B_{m,i}\psi_m$ .

Thus the cols of  $B$ , namely the rows of  $A$ , are linely inde (check it by contradiction).

(b) Suppose the rows of  $A$  are linely inde, so are the cols of  $B$ .

Then  $(T'(\varphi_1), \dots, T'(\varphi_m))$  is a basis of range  $T'$ , namely  $V'$ . Thus  $T'$  is surj.

Hence  $T'$  is inv, so is  $T$ . □

**34** The double dual space of  $V$ , denoted by  $V''$ , is defined to be the dual space of  $V'$ .

In other words,  $V'' = \mathcal{L}(V', \mathbf{F})$ . Define  $\Lambda : V \rightarrow V''$  by  $(\Lambda v)(\varphi) = \varphi(v)$ .

(a) Show that  $\Lambda$  is a linear map from  $V$  to  $V''$ .

(b) Show that if  $T \in \mathcal{L}(V)$ , then  $T'' \circ \Lambda = \Lambda \circ T$ , where  $T'' = (T')'$ .

(c) Show that if  $V$  is finite-dim, then  $\Lambda$  is an iso from  $V$  onto  $V''$ .

Suppose  $V$  is finite-dim. Then  $V$  and  $V'$  are iso, but finding an iso from  $V$  onto  $V'$  generally requires choosing a basis of  $V$ . In contrast, the iso  $\Lambda$  from  $V$  onto  $V''$  does not require a choice of basis and thus is considered more natural.

**SOLUTION:**

(a)  $\forall \varphi \in V', \forall v, w \in V, a \in \mathbf{F}, (\Lambda(v + aw))(\varphi) = \varphi(v + aw) = \varphi(v) + a\varphi(w) = (\Lambda v)(\varphi) + a(\Lambda w)(\varphi)$ .

Thus  $\Lambda(v + aw) = \Lambda v + a\Lambda w$ . Hence  $\Lambda$  is linear.

(b)  $(T''(\Lambda v))(\varphi) = ((\Lambda v) \circ (T'))(\varphi) = (\Lambda v)(T'(\varphi)) = (T'(\varphi))(v) = (\varphi \circ T)(v) = \varphi(Tv) = (\Lambda(Tv))(\varphi)$ .

Hence  $T''(\Lambda v) = (\Lambda(Tv))$ , getting  $T'' \circ \Lambda = \Lambda \circ T$ .

(c) Suppose  $\Lambda v = 0$ . Then  $\forall \varphi \in V', (\Lambda v)(\varphi) = \varphi(v) = 0 \Rightarrow v = 0$ . Thus  $\Lambda$  is inje.

又 Because  $V$  is finite-dim.  $\dim V = \dim V' = \dim V''$ . Hence  $\Lambda$  is an iso. □

**36** Suppose  $U$  is a subsp of  $V$ . Define  $i : U \rightarrow V$  by  $i(u) = u$ . Thus  $i' \in \mathcal{L}(V', U')$ .

(a) Show that  $\text{null } i' = U^0$ :  $\text{null } i' = (\text{range } i)^0 = U^0 \Leftarrow \text{range } i = U$ . □

(b) Prove that if  $V$  is finite-dim, then  $\text{range } i' = U'$ :  $\text{range } i' = (\text{null } i)_U^0 = (\{0\})_U^0 = U'$ . □

(c) Prove that if  $V$  is finite-dim, then  $\tilde{i}'$  is an iso from  $V'/U^0$  onto  $U'$ :

The iso in (c) is natural in that it does not depend on a choice of basis in either vecsp.

**SOLUTION:** Note that  $\tilde{i}' : V'/\text{null } i' \rightarrow \text{range } i' \Rightarrow \tilde{i}' : V'/U^0 \rightarrow U'$ . By (a), (b) and [3.91(d)]. □

**37** Suppose  $U$  is a subsp of  $V$  and  $\pi$  is the quotient map. Thus  $\pi' \in \mathcal{L}((V/U)', V')$ .

(a) Show that  $\pi'$  is inje: Because  $\pi$  is surj. Use [3.108]. □

(b) Show that  $\pi' = U^0$ .

(c) Conclude that  $\pi'$  is an iso from  $(V/U)'$  onto  $U^0$ .

The iso in (c) is natural in that it does not depend on a choice of basis in either vecsp.

In fact, there is no assumption here that any of these vecsp are finite-dim.

**SOLUTION:** [3.109] is not available. Using (3.E.18), also see (3.E.20).

(b)  $\psi \in \text{range } \pi' \Leftrightarrow \exists \varphi \in (V/U)', \psi = \varphi \circ \pi \Leftrightarrow \text{null } \psi \supseteq U \Leftrightarrow \psi \in U^0$ . Hence  $\text{range } \pi' = U^0$ .

(c)  $\psi \in U^0 \Leftrightarrow \text{null } \psi \supseteq U \Leftrightarrow \exists \varphi \in (V/U)', \psi = \varphi \circ \pi = \pi(\varphi)$ . Thus  $\pi'$  is surj. And by (a). □

Then  $p(z) = p(z) - p(\lambda) = a_1(z - \lambda) + \dots + a_m(z^m - \lambda^m)$  for all  $z \in \mathbf{F}$ .

*Every nonconst poly with complex coefficients has a zero in  $\mathbf{C}$ . Another Proof:*

For any  $w \in \mathbf{C}, k \in \mathbf{N}^+$ , by polar coordinates,  $\exists r \geq 0, \theta \in \mathbf{R}, r(\cos \theta + i \sin \theta) = w$ .

By De Moivre' theorem,  $w^k = [r(\cos \theta + i \sin \theta)]^k = r^k(\cos k\theta + i \sin k\theta)$ .

Hence  $(r^{1/k}(\cos \frac{\theta}{k} + i \sin \frac{\theta}{k}))^k = w$ . Thus every complex number has a  $k^{\text{th}}$  root.

Suppose a nonconst  $p \in \mathcal{P}(\mathbf{C})$  with highest-order nonzero term  $c_m z^m$ .

Then  $|p(z)| \rightarrow \infty$  as  $|z| \rightarrow \infty$  (because  $\frac{|p(z)|}{|z_m|} \rightarrow |c_m|$  as  $|z| \rightarrow \infty$ ).

Thus the continuous function  $z \rightarrow |p(z)|$  has a global minimum at some point  $\zeta \in \mathbf{C}$ .

To show that  $p(\zeta) = 0$ , assume  $p(\zeta) \neq 0$ . Define  $q \in \mathcal{P}(\mathbf{C})$  by  $q(z) = \frac{p(z + \zeta)}{p(\zeta)}$ .

$p$  has  $m$  distinct zeros  $\iff p$  and its derivative  $p'$  have no zeros in common.

(a) Suppose  $p$  has  $m$  distinct zeros. By [4.14] and  $\deg p = m$ , let  $p(z) = c(z - \lambda_1) \cdots (z - \lambda_m)$ ,  $\exists! c, \lambda_i \in \mathbf{C}$ .

For each  $j \in \{1, \dots, m\}$ , let  $\frac{p(z)}{(z - \lambda_j)} = q_j \in \mathcal{P}_{m-1}(\mathbf{C})$ , then  $p(z) = (z - \lambda_j)q_j(z)$  and  $q_j(\lambda_j) \neq 0$ .

$p'(z) = (z - \lambda_j)q_j'(z) + q_j(z) \Rightarrow p'(\lambda_j) = q_j(\lambda_j) \neq 0$ , as desired.

(b) To prove the implication on the other direction, we prove the contrapositive:

Suppose  $p$  has less than  $m$  distinct roots.

We must show that  $p$  and its derivative  $p'$  have at least one zero in common.

Let  $\lambda$  be a zero of  $p$ , then write  $p(z) = (z - \lambda)^n q(z)$ ,  $\exists! n \in \mathbf{N}^+, q \in \mathcal{P}_{m-n}(\mathbf{C})$ .

Suppose  $p \in \mathcal{P}_m(\mathbf{F})$ ,  $\deg p = m$ ,  $m$  is odd.

Let  $p(x) = a_0 + a_1x + \cdots + a_mx^m$ . Then  $a_m \neq 0$ . Denote  $|a_m|^{-1}a_m$  by  $\delta$

Write  $p(x) = x^m \left( \frac{a_0}{x^m} + \frac{a_1}{x^{m-1}} + \cdots + \frac{a_{m-1}}{x} + a_m \right)$ .

Thus  $p(x)$  is continuous, and  $\lim_{x \rightarrow -\infty} p(x) = -\delta\infty$ ;  $\lim_{x \rightarrow \infty} p(x) = \delta\infty$ .

Hence we conclude that  $p$  has at least one real zero. □

**8** For  $p \in \mathcal{P}(\mathbf{R})$ , define  $Tp : \mathbf{R} \rightarrow \mathbf{R}$  by  $(Tp)(x) = \begin{cases} \frac{p(x) - p(3)}{x - 3} & \text{if } x \neq 3, \\ p'(3) & \text{if } x = 3 \end{cases}$  for all  $x \in \mathbf{R}$ .

Show that  $Tp \in \mathcal{P}(\mathbf{R})$  for all  $p \in \mathcal{P}(\mathbf{R})$  and that  $T : \mathcal{P}(\mathbf{R}) \rightarrow \mathcal{P}(\mathbf{R})$  is a linear map.

**SOLUTION:**

For  $x \neq 3$ ,  $T(x^n) = \frac{x^n - 3^n}{x - 3} = \sum_{i=1}^n 3^{i-1}x^{n-i}$ .

For  $x = 3$ ,  $T(x^n) = 3^{n-1} \cdot n$ . Note that if  $x = 3$ , then  $\sum_{i=1}^n 3^{i-1}x^{n-i} = \sum_{i=1}^n 3^{n-1} = 3^{n-1} \cdot n$ .

Hence for all  $x \in \mathbf{R}$  and for all  $n \in \mathbf{N}$ ,  $T(x^n) = \sum_{i=1}^n 3^{i-1}x^{n-i} \in \mathcal{P}(\mathbf{R})$ .

Because  $T$  is linear, we conclude that  $Tp \in \mathcal{P}(\mathbf{R})$  for all  $p \in \mathcal{P}(\mathbf{R})$ .

Now we show that  $T$  is linear:

Notice that  $\begin{cases} (p + \lambda q)(x) - (p + \lambda q)(3) = (p(x) - p(3)) + (\lambda q(x) - \lambda q(3)). \\ (p + \lambda q)'(3) = p'(3) + \lambda q'(3). \end{cases}$

$p(z) = a_n z^n + \cdots + a_1 z + a_0 \Rightarrow p(\bar{z}) = a_n \bar{z}^n + \cdots + a_1 \bar{z} + a_0 \Rightarrow \overline{p(\bar{z})} = \overline{a_n} z^n + \cdots + \overline{a_1} z + \overline{a_0}$ .

Note that  $q(z) = p(z)\overline{p(\bar{z})} = \overline{p(\bar{z})}p(z) = \overline{p(\bar{z})p(\bar{z})} = \overline{q(\bar{z})}$ .

Hence letting  $q(z) = c_m z^m + \cdots + c_1 z + c_0 \Rightarrow \overline{c_k} = c_k, c_k \in \mathbf{R}$  for each  $k$ . □

Let  $p(x_k) = y_k$  for each  $k$ . By Problem (5),  $\exists ! q \in \mathcal{P}_m(\mathbf{R})$  such that  $q(x_k) = y_k$ . Hence  $p = q$ . □

OR. Using the Lagrange Interpolating Polynomial.

Define  $q(x) = \sum_{j=0}^m \frac{(x - x_0)(x - x_1) \cdots (x - x_{j-1})(x - x_{j+1}) \cdots (x - x_m)}{(x_j - x_0)(x_j - x_1) \cdots (x_j - x_{j-1})(x_j - x_{j+1}) \cdots (x_j - x_m)} p(x_j)$ .

又 For each  $j$ ,  $x_j, p(x_j) \in \mathbf{R} \Rightarrow q \in \mathcal{P}_m(\mathbf{R}) \subseteq \mathcal{P}_m(\mathbf{C})$ .

Notice that  $q(x_k) = 1 \cdot p(x_k) \Rightarrow (q - p)(x_k) = 0$  for each  $k \in \{0, 1, \dots, m\}$ .

Then  $(q - p)$  has  $(m + 1)$  distinct zeros, while  $(q - p) \in \mathcal{P}_m(\mathbf{C})$ . Hence by [4.12],  $q - p = 0 \Rightarrow p = q$

**11** Suppose  $p \in \mathcal{P}(\mathbf{F})$  with  $p \neq 0$ . Let  $U = \{pq : q \in \mathcal{P}(\mathbf{F})\}$ .

(a) Show that  $\dim \mathcal{P}(\mathbf{F})/U = \deg p$ .

(b) Find a basis of  $\mathcal{P}(\mathbf{F})/U$ .

**SOLUTION:**

$U$  is a subsp of  $\mathcal{P}(\mathbf{F})$  because  $\forall f, g \in \mathcal{P}(\mathbf{F}), \lambda \in \mathbf{F}, pf + \lambda pg = p(f + \lambda g) \in U$ .

NOTE: Define  $P : \mathcal{P}(\mathbf{F}) \rightarrow \mathcal{P}(\mathbf{F})$  by  $(Pq)(x) = p(q(x)) = (p \circ q)(x) (\neq p(x)q(x))$ .  $P$  is not linear.

(a) By [4.8],  $\forall f \in \mathcal{P}(\mathbf{F}), \exists! q, r \in \mathcal{P}(\mathbf{F}), f = (p)q + (r); \deg r < \deg p$ .

Hence  $\forall f \in \mathcal{P}(\mathbf{F}), \exists! pq \in U, r \in \mathcal{P}_{\deg p-1}(\mathbf{F}), f = (pq) + (r); r \notin U$ .

Thus  $\mathcal{P}(\mathbf{F}) = U \oplus \mathcal{P}_{\deg p-1}(\mathbf{F})$ . Therefore  $\mathcal{P}(\mathbf{F})/U$  and  $\mathcal{P}_{\deg p-1}(\mathbf{F})$  are iso.

OR.  $\forall f \in \mathcal{P}(\mathbf{F}), \exists! q, r \in \mathcal{P}(\mathbf{F}), f = (p)q + (r); \deg r < \deg p$ .

Define  $R : \mathcal{P}(\mathbf{F}) \rightarrow \mathcal{P}_{\deg p-1}(\mathbf{F})$  by  $(Rf)(z) = r(z)$  for each  $z \in \mathbf{F}$ .

$\forall f, g \in \mathcal{P}(\mathbf{F}), \lambda \in \mathbf{F}, R(f + \lambda g)(z) = R(f)(z) + \lambda R(g)(z)$ .

BECAUSE:  $\forall f, g \in \mathcal{P}(\mathbf{F}), \lambda \in \mathbf{F}$ ,

$\exists! q_1, r_1 \in \mathcal{P}(\mathbf{F}), f = (p)q_1 + (r_1), \deg r_1 < \deg p$ ;

$\exists! q_2, r_2 \in \mathcal{P}(\mathbf{F}), g = (p)q_2 + (r_2), \deg r_2 < \deg p$ ;

$\exists! q_3, r_3 \in \mathcal{P}(\mathbf{F}), \lambda g = (p)q_3 + (r_3) = (p)(\lambda q_2) + (\lambda r_2), \deg r_3 < \deg p$  and  $\deg \lambda r_2 < \deg p$ .

$\Rightarrow q_3 = \lambda q_2, r_3 = \lambda r_2$ .

$\exists! q_0, r_0 \in \mathcal{P}(\mathbf{F}), (f + \lambda g) = (p)q_0 + (r_0)$

$= (p)(q_1 + \lambda q_2) + (r_1 + \lambda r_2), \deg r_0 < \deg p$  and  $\deg (r_1 + \lambda r_2) < \deg p$ .

$\Rightarrow q_1 + \lambda q_2 = q_0; r_1 + \lambda r_2 = r_0$ .

Hence  $R$  is linear.

$R(f) = 0 \iff f = pq, \exists! q \in \mathcal{P}(\mathbf{F})$ . Thus  $\text{null } R = U$ .

$\forall r \in \mathcal{P}_{\deg p-1}(\mathbf{F})$ , let  $f = p + r$ , then  $R(f) = r$ . Thus  $\text{range } R = \mathcal{P}_{\deg p-1}(\mathbf{F})$ .

Finally, by [3.91(d)],  $\mathcal{P}(\mathbf{F})/\text{null } R$ , namely  $\mathcal{P}(\mathbf{F})/U$ , and  $\text{range } R$ , namely  $\mathcal{P}_{\deg p-1}(\mathbf{F})$ , are iso.

(b)  $(1 + U, x + U, \dots, x^{\deg p-1} + U)$  can be a basis of  $\mathcal{P}(\mathbf{F})/U$ . □

• Suppose nonconst  $p, q \in \mathcal{P}(\mathbf{C})$  have no zeros in common. Let  $m = \deg p, n = \deg q$ .

Use (a)–(c) below to prove that  $\exists! r \in \mathcal{P}_{n-1}(\mathbf{C}), s \in \mathcal{P}_{m-1}(\mathbf{C})$  such that  $rp + sq = 1$ .

(a) Define  $T : \mathcal{P}_{n-1}(\mathbf{C}) \times \mathcal{P}_{m-1}(\mathbf{C}) \rightarrow \mathcal{P}_{m+n-1}(\mathbf{C})$  by  $T(r, s) = rp + sq$ .

Show that the linear map  $T$  is inje.

(b) Show that the linear map  $T$  in (a) is surj.

(c) Use (b) to conclude that  $\exists! r \in \mathcal{P}_{n-1}(\mathbf{C}), s \in \mathcal{P}_{m-1}(\mathbf{C})$  such that  $rp + sq = 1$ .

**SOLUTION:**

(a)  $T$  is linear because  $\forall r_1, r_2 \in \mathcal{P}_{n-1}(\mathbf{C}), s_1, s_2 \in \mathcal{P}_{m-1}(\mathbf{C}), \lambda \in \mathbf{F}$ ,

$T((r_1, s_1) + \lambda(r_2, s_2)) = T(r_1 + \lambda r_2, s_1 + \lambda s_2) = (r_1 + \lambda r_2)p + (s_1 + \lambda s_2)q = T(r_1, s_1) + \lambda T(r_2, s_2)$ .

Suppose  $T(r, s) = rp + sq = 0$ . Notice that  $p, q$  have no zeros in common.

Then  $r = s = 0$ , for if not, write  $\frac{q(z)}{r(z)} = \frac{p(z)}{s(z)}$ , while for any zero  $\lambda$  of  $q$ ,  $\frac{q(\lambda)r(z)}{=0} \neq \frac{p(\lambda)s(z)}{=}$ . □

(b)  $\dim(\mathcal{P}_{n-1}(\mathbf{C}) \times \mathcal{P}_{m-1}(\mathbf{C})) = \dim \mathcal{P}_{n-1}(\mathbf{C}) + \dim \mathcal{P}_{m-1}(\mathbf{C}) = n + m = \dim \mathcal{P}_{m+n-1}(\mathbf{C})$ .

又  $T$  is inje. Hence  $\dim \text{range } T = \dim(\mathcal{P}_{n-1}(\mathbf{C}) \times \mathcal{P}_{m-1}(\mathbf{C})) - \dim \text{null } T = \dim \mathcal{P}_{m+n-1}(\mathbf{C})$ .

Thus  $\text{range } T = \mathcal{P}_{m+n-1}(\mathbf{C}) \Rightarrow T$  is surj, and therefore is an iso.

(c) Immediately. □

Prove that if  $\lambda$  is an eigval of  $P$ , then  $\lambda = 0$  or  $\lambda = 1$ .

**SOLUTION:** ( See also at (3.B), just below Problem (25), where (5.B.4) was answered. )

Suppose  $\lambda$  is an eigval with an eigvec  $v$ . Then  $P(Pv) = Pv \Rightarrow \lambda^2 v = \lambda v$ . Thus  $\lambda = 1$  or  $0$ . □

**22** Suppose  $T \in \mathcal{L}(V)$  and  $\exists$  nonzero vecs  $u, w$  in  $V$  such that  $Tu = 3w$  and  $Tw = 3u$ .

Prove that  $3$  or  $-3$  is an eigval of  $T$ .

**SOLUTION: COMMENT:**  $Tu = 3w, Tw = 3u \Rightarrow T(Tu) = 9u \Rightarrow T^2$  has an eigval  $9$ .

$Tu = 3w, Tw = 3u \Rightarrow T(u + w) = 3(u + w), T(u - w) = 3(w - u) = -3(u - w)$ . □

**9** Define  $T \in \mathcal{L}(\mathbf{F}^3)$  by  $T(z_1, z_2, z_3) = (2z_2, 0, 5z_3)$ .

Find all eigvals and eigvecs of  $T$ .

**SOLUTION:**

Suppose  $\lambda$  is an eigval of  $T$  with an eigvec  $(z_1, z_2, z_3) \in \mathbf{F}^3$ .

Then  $T(z_1, z_2, z_3) = (2z_2, 0, 5z_3) = \lambda(z_1, z_2, z_3)$ . Thus  $2z_2 = \lambda z_1, 0 = \lambda z_2, 5z_3 = \lambda z_3$ .

We discuss in two cases:

For  $\lambda = 0, z_2 = z_3 = 0$  and  $z_1$  can be arbitrary (  $z_1 \neq 0$  ).

For  $\lambda \neq 0, z_2 = 0 = z_1$ , and  $z_3$  can be arbitrary (  $z_3 \neq 0$  ), then  $\lambda = 5$ .

The set of all eigvecs is  $\{(0, 0, z), (z, 0, 0) : z \in \mathbf{F} \wedge z \neq 0\}$ . □

**10** Define  $T \in \mathcal{L}(\mathbf{F}^n)$  by  $T(x_1, x_2, x_3, \dots, x_n) = (x_1, 2x_2, 3x_3, \dots, nx_n)$

(a) Find all eigvals and eigvecs of  $T$ .

(b) Find all invar subsp of  $V$  under  $T$ .

**SOLUTION:**

(a) Suppose  $v = (x_1, x_2, x_3, \dots, x_n)$  is an eigvec of  $T$  with an eigval  $\lambda$ .

Then  $Tv = \lambda v = (x_1, 2x_2, 3x_3, \dots, nx_n) = (\lambda x_1, \lambda x_2, \lambda x_3, \dots, \lambda x_n)$ .

Hence  $1, \dots, n$  are eigvals of  $T$ .

And  $\{(0, \dots, 0, x_\lambda, 0, \dots, 0) \in \mathbb{F}^n : \lambda = 1, \dots, n, x_\lambda \in \mathbb{F} \wedge x_\lambda \neq 0\}$  is the set of all eigvecs of  $T$ .

(b) Let  $V_\lambda = \{(0, \dots, 0, x_\lambda, 0, \dots, 0) \in \mathbb{F}^n : x_\lambda \in \mathbb{F} \wedge x_\lambda \neq 0\}$ . Then  $V_1, \dots, V_n$  are invar under  $T$ .

Hence by Problem (4), every sum of  $V_1, \dots, V_n$  is a invar subsp of  $V$  under  $T$ . □

**11** Define  $T : \mathcal{P}(\mathbb{R}) \rightarrow \mathcal{P}(\mathbb{R})$  by  $Tp = p'$ . Find all eigvals and eigvecs of  $T$ .

**SOLUTION:**

Note that in general,  $\deg p' < \deg p$  ( $\deg 0 = -\infty$ ).

Suppose  $\lambda$  is an eigval of  $T$  with an eigvec  $p$ .

Suppose  $\lambda \neq 0$ . Then  $\deg \lambda p > \deg p'$  while  $\lambda p \neq p'$ . Contradicts. Thus  $\lambda = 0$ .

Therefore  $\deg \lambda p = -\infty = \deg p \Rightarrow p$  is a nonzero const poly.

Hence the set of all eigvecs is  $\{C : C \in \mathbb{R} \wedge C \neq 0\} = \mathcal{P}_0(\mathbb{R}) \setminus \{0\}$ . □

**12** Define  $T \in \mathcal{L}(\mathcal{P}_4(\mathbb{R}))$  by  $(Tp)(x) = xp'(x)$  for all  $x \in \mathbb{R}$ .  
Find all eigvals and eigvecs of  $T$ .

**SOLUTION:**

Suppose  $\lambda$  is an eigval of  $T$  with an eigvec  $p$ , then  $(Tp)(x) = xp'(x) = \lambda p(x)$ .

Let  $p = a_0 + a_1x + \dots + a_nx^n$ .

Then  $xp'(x) = a_1x + 2a_2x^2 + \dots + na_nx^n = \lambda a_0 + \lambda a_1x + \lambda a_2x^2 + \dots + \lambda a_nx^n$ .

Similar to Problem (10),  $0, 1, \dots, n$  are eigvals of  $T$ .

The set of all eigvecs of  $T$  is  $\{cx^\lambda : \lambda = 0, 1, \dots, n, c \in \mathbb{F} \wedge c \neq 0\}$ . □

**30** Suppose  $T \in \mathcal{L}(\mathbb{R}^3)$  and  $-4, 5, \sqrt{7}$  are eigvals of  $T$ .

Prove that  $\exists x \in \mathbb{R}^3$  such that  $Tx - 9x = (-4, 5, \sqrt{7})$ .

**SOLUTION:** Because 9 is not an eigval. Hence  $(T - 9I)$  is surj. □

**14** Suppose  $V = U \oplus W$ , where  $U$  and  $W$  are nonzero subsp of  $V$ .

Define  $P \in \mathcal{L}(V)$  by  $P(u + w) = u$  for each  $u \in U$  and each  $w \in W$ .

Find all eigvals and eigvecs of  $P$ .

**SOLUTION:**

Suppose  $\lambda$  is an eigval of  $P$  with an eigvec  $(u + w)$ .

Then  $P(u + w) = u = \lambda u + \lambda w \Rightarrow (\lambda - 1)u + \lambda w = 0$ . By [1.44] and  $V = U \oplus W$ ,  $(\lambda - 1)u = \lambda w = 0$ .

Thus if  $\lambda = 1$ , then  $w = 0$ ; if  $\lambda = 0$ , then  $u = 0$ .

Hence the eigvals of  $P$  are 0 and 1, the set of all eigvecs in  $P$  is  $U \cup W$ . □

Prove that  $\exists \alpha \in \mathbb{F}, |\alpha - \lambda| < \frac{1}{1000}$  and  $(T - \alpha I)$  is inv.

**SOLUTION:**

Let  $\alpha_k \in \mathbb{F}$  be such that  $|\alpha_k - \lambda| = \frac{1}{1000 + k}$  for each  $k = 1, \dots, \dim V + 1$ .

Note that each  $T \in \mathcal{L}(V)$  has at most  $\dim V$  distinct eigvals.

Hence  $\exists k = 1, \dots, \dim V + 1$  such that  $\alpha_k$  is not an eigval of  $T$  and therefore  $(T - \alpha_k I)$  is inv.  $\square$

Prove that  $\exists \delta > 0$  such that  $(T - \alpha I)$  is inv for all  $\alpha \in \mathbb{F}$  such that  $0 < |\alpha - \lambda| < \delta$ .

**SOLUTION:**

If  $T$  has no eigvals, then  $(T - \alpha I)$  is inje for all  $\alpha \in \mathbb{F}$  and we are done.

Let  $\delta > 0$  be such that, for each eigval  $\lambda_k$ ,  $\lambda_k \notin (\lambda - \delta, \lambda) \cup (\lambda, \lambda + \delta)$ .

So that for all  $\alpha \in \mathbb{F}$  such that  $0 < |\alpha - \lambda| < \delta$ ,  $(T - \alpha I)$  is not inje.  $\square$

If  $xy \neq 0$  or  $zw \neq 0$ , then  $\lambda^2 = -1$ , we fail.

Otherwise,  $xy = 0 \Rightarrow x = y = 0$ , for if  $x \neq 0$ , then  $\lambda = 0 \Rightarrow x = 0$ , contradicts.

Similarly,  $y = z = w = 0$ . Then we fail. Thus  $T$  has no eigvals.  $\square$

Prove that if  $\lambda$  is an eigval of  $T$ , then  $|\lambda| \leq n \max \{ |A_{j,k}| : 1 \leq j, k \leq n \}$ .

**SOLUTION:**

First we show that  $|\lambda| = n \max \{ |A_{j,k}| : 1 \leq j, k \leq n \}$  for some cases.

Consider  $A = \begin{pmatrix} k & \dots & k \\ \vdots & \ddots & \vdots \\ k & \dots & k \end{pmatrix}$ . Then  $nk$  is an eigval of  $T$  with an eigvec  $v_1 + \dots + v_n$ .

Now we show that if  $|\lambda| \neq n \max \{ |A_{j,k}| : 1 \leq j, k \leq n \}$ , then  $|\lambda| < n \max \{ |A_{j,k}| : 1 \leq j, k \leq n \}$ .

Thus  $\lambda z_1 = 0, \lambda z_2 = z_1, \dots, \lambda z_k = z_{k-1}, \dots$ .

Let  $\lambda = 0$ , then  $\lambda z_2 = z_1 = 0 = \lambda z_k = z_{k-1}$ , therefore  $(z_1, z_2, \dots) = 0$  is not an eigvec.

Suppose  $\lambda \neq 0$ . Then  $\lambda z_1 = 0 \Rightarrow z_1 = 0 \Rightarrow z_2 = 0 = z_k$  for all  $k \in \mathbb{N}^+$ .

Then  $(z_1, \lambda z_1, \lambda^2 z_1, \dots, \lambda^k z_1, \dots)$  is an eigvec with  $z_1 \neq 0$ .

Because every subsp such  $U$  is invar.

Thus  $Tv_1 = c_1 v_1 + \dots + c_n v_n \in U \Rightarrow c_2 = \dots = c_n = 0$ ,

for if not, for each  $c_i \neq 0$ , choose  $U_i$  such that  $\alpha_j \in \overbrace{\{2, \dots, i-1, i+1, \dots, n\}}^{\text{length}(n-2)}$  for each  $j$ ,

hence for  $Tv_1 = c_1 v_1 + \dots + c_{i-1} v_{i-1} + c_{i+1} v_{i+1} + \dots + c_n v_n \in U_i$ , we conclude that  $c_i = 0$ .

$T$  has an eigval  $\iff \exists$  an invar subsp  $U$  of  $V$  under  $T$  such that  $\dim U = \dim V - 1$ .

**SOLUTION:**

(a) Suppose  $\lambda$  is an eigval of  $T$  with an eigvec  $v$ .

( If  $\dim V = 1$ , then  $U = \{0\}$  and we are done. )

Extend  $v_1 = v$  to a basis of  $V$  as  $(v_1, v_2, \dots, v_n)$ .

**Step 1.** If  $\exists w_1 \in \text{span}(v_2, \dots, v_n)$  such that  $0 \neq Tw_1 \in \text{span}(v_1)$ ,

then extend  $w_1 = \alpha_{1,1}$  to a basis of  $\text{span}(v_2, \dots, v_n)$  as  $(\alpha_{1,1}, \dots, \alpha_{1,n-1})$ .

Otherwise, we stop at step 1.

$\vdots$

**Step k.** If  $\exists w_k \in \text{span}(\alpha_{k-1,2}, \dots, \alpha_{k-1,n-k+1})$  such that  $0 \neq Tw_k \in \text{span}(v_1, w_1, \dots, w_{k-1})$ ,

then extend  $w_k = \alpha_{k,1}$  to a basis of  $\text{span}(\alpha_{k-1,2}, \dots, \alpha_{k-1,n-k+1})$  as  $(\alpha_{k,1}, \dots, \alpha_{k,n-k})$ .

Otherwise, we stop at step k.

$\vdots$

Finally, we stop at step  $m$ , thus we get  $(v_1, w_1, \dots, w_{m-1})$  and  $(\alpha_{m-1,2}, \dots, \alpha_{m-1,n-m+1})$ ,

$\text{range } T|_{\text{span}(w_1, \dots, w_{m-1})} = \text{span}(v_1, w_1, \dots, w_{m-2}) \Rightarrow \dim \text{null } T|_{\text{span}(w_1, \dots, w_{m-1})} = 0$ ,

$\underbrace{\text{span}(v_1, w_1, \dots, w_{m-1})}_{\dim m}$  and  $\underbrace{\text{span}(\alpha_{m-1,2}, \dots, \alpha_{m-1,n-m+1})}_{\dim(n-m)}$  are invar under  $T$ .

Let  $U = \text{span}(\alpha_{m-1,2}, \dots, \alpha_{m-1,n-m+1}) \oplus \text{span}(v_1, w_1, \dots, w_{m-2})$  and we are done.  $\square$

**COMMENT:** Both  $\text{span}(v_2, \dots, v_n)$  and  $\text{span}(\alpha_{m-1,2}, \dots, \alpha_{m-1,n-m+1}) \oplus \text{span}(w_1, \dots, w_{m-1})$  are in  $\mathcal{S}_V \text{span}(v_1)$ .

(b) Suppose  $U$  is an invar subspace of  $V$  under  $T$  with  $\dim U = m = \dim V - 1$ .

( If  $m = 0$ , then  $\dim V = 1$  and we are done. )

Let  $(u_1, \dots, u_m)$  be a basis of  $U$ , extend to a basis of  $V$  as  $(u_0, u_1, \dots, u_m)$ .

We discuss in cases:

For  $Tu_0 \in U$ , then  $\text{range } T = U$  so that  $T$  is not surj  $\iff \text{null } T \neq \{0\} \iff 0$  is an eigval of  $T$ .

For  $Tu_0 \notin U$ , then  $Tu_0 = a_0u_0 + a_1u_1 + \dots + a_mu_m$ .

(1) If  $Tu_0 \in \text{span}(u_0)$ , then we are done.

(2) Otherwise, if  $\text{range } T|_U = U$ , then  $Tu_0 = a_0u_0$  and we are done;

otherwise,  $T|_U : U \rightarrow U$  is not surj (  $\Rightarrow$  not inje ), suppose  $\text{range } T|_U \neq \{0\}$

( Suppose  $\text{range } T|_U = \{0\}$ . If  $\dim U = 0$  then we are done.

Otherwise  $\exists u \in U \setminus \{0\}, Tu = 0$  and we are done. )

then  $\exists u \in U \setminus \{0\}, Tu = 0$ , we are done.  $\square$

**29** Suppose  $T \in \mathcal{L}(V)$  and  $\text{range } T$  is finite-dim.

Prove that  $T$  has at most  $1 + \dim \text{range } T$  distinct eigvals.

**SOLUTION:**

Let  $\lambda_1, \dots, \lambda_m$  be the distinct eigvals of  $T$  and let  $v_1, \dots, v_m$  be the correspd eigvecs.

( Because  $\text{range } T$  is finite-dim. Let  $(v_1, \dots, v_n)$  be a list of all the linely inde eigvecs of  $T$ , so that the correspd eigvals are finite. )

For every  $\lambda_k \neq 0, T(\frac{1}{\lambda_k}v_k) = v_k$ . And if  $T = T - 0I$  is not inje, then  $\exists ! \lambda_A = 0$  and  $Tv_A = \lambda_A v_A = 0$ .

Thus for  $\lambda_k \neq 0, \forall k, \mathcal{L}(Tv_1, \dots, Tv_m)$  is a linely inde list of length  $m$  in  $\text{range } T$ .

And for  $\lambda_A = 0$ , there is a linely inde list of length at most  $(m - 1)$  in  $\text{range } T$ .

Hence, by [2.23],  $m \leq \dim \text{range } T + 1$ .  $\square$

**32** Suppose that  $\lambda_1, \dots, \lambda_n$  are distinct real numbers.

Prove that  $(e^{\lambda_1}x, \dots, e^{\lambda_n}x)$  is linely inde in  $\mathbb{R}^{\mathbb{R}}$ .

HINT: Let  $V = \text{span}(e^{\lambda_1 x}, \dots, e^{\lambda_n x})$ , and define an operator  $D \in \mathcal{L}(V)$  by  $Df = f'$ . Find eigvals and eigvecs of  $D$ .

**SOLUTION:**

Define  $V$  and  $D \in \mathcal{L}(V)$  as in HINT. Then because for each  $k$ ,  $D(e^{\lambda_k x}) = \lambda_k e^{\lambda_k x}$ .

Thus  $\lambda_1, \dots, \lambda_n$  are distinct eigvals of  $D$ . By [5.10],  $(e^{\lambda_1 x}, \dots, e^{\lambda_n x})$  is linely inde in  $\mathbb{R}^{\mathbb{R}}$ . □

• Suppose  $\lambda_1, \dots, \lambda_n$  are distinct positive numbers.

Prove that  $(\cos(\lambda_1 x), \dots, \cos(\lambda_n x))$  is linely inde in  $\mathbb{R}^{\mathbb{R}}$ .

**SOLUTION:**

Let  $V = \text{span}(\cos(\lambda_1 x), \dots, \cos(\lambda_n x))$ . Define  $D \in \mathcal{L}(V)$  by  $Df = f'$ .

Then because  $D(\cos(\lambda_k x)) = -\lambda_k \sin(\lambda_k x)$ . 又  $D(\sin(\lambda_k x)) = \lambda_k \cos(\lambda_k x)$ .

Thus  $D^2(\cos(\lambda_k x)) = -\lambda_k^2 \cos(\lambda_k x)$ .

Notice that  $\lambda_1, \dots, \lambda_n$  are distinct  $\Rightarrow -\lambda_1^2, \dots, -\lambda_n^2$  are distinct.

Hence  $-\lambda_1^2, \dots, -\lambda_n^2$  are distinct eigvals of  $D^2$

with the correspd eigvecs  $\cos(\lambda_1 x), \dots, \cos(\lambda_n x)$  respectively.

And then  $(\cos(\lambda_1 x), \dots, \cos(\lambda_n x))$  is linely inde in  $\mathbb{R}^{\mathbb{R}}$ . □

• Suppose  $V$  is finite-dim,  $T \in \mathcal{L}(V)$ , and  $U$  is a subsp of  $V$  invar under  $T$ .

The quotient operator  $T/U \in \mathcal{L}(V/U)$  is defined by

$$(T/U)(v + U) = Tv + U \text{ for each } v \in V.$$

(a) Show that the definition of  $T/U$  makes sense

( which requires using the condition that  $U$  is invar under  $T$  )

and show that  $T/U$  is an operator on  $V/U$ .

(b) (OR Problem 35) Show that each eigval of  $T/U$  is an eigval of  $T$ .

**SOLUTION:**

(a) Suppose  $v + U = w + U$  (  $\Leftrightarrow v - w \in U$  ).

Then because  $U$  is invar under  $T$ ,  $T(v - w) \in U \Leftrightarrow Tv + U = Tw + U$ .

Hence the definition of  $T/U$  makes sense.

Now we show that  $T/U$  is linear.

$$\begin{aligned} \forall v + U, w + U \in V/U, \lambda \in \mathbb{F}, (T/U)((v + U) + \lambda(w + U)) \\ = T(v + \lambda w) + U = (Tv + U) + \lambda(Tw + U) \\ = (T/U)(v + U) + \lambda(T/U)(w). \end{aligned}$$

(b) Suppose  $\lambda$  is an eigval of  $T/U$  with an eigvec  $v + U$ .

Then  $(T/U)(v + U) = \lambda(v + U) = Tv + U = \lambda v + U \Rightarrow (T - \lambda I)v \in U$ .

If  $(T - \lambda I)v = 0 \Rightarrow Tv = \lambda v$ , then we are done.

Otherwise, then  $(T|_U - \lambda I) : U \rightarrow U$  is inv,

$$\text{hence } \exists! w \in U, (T|_U - \lambda I)(w) = (T - \lambda I)v \Rightarrow T(v - w) = \lambda(v - w).$$

Note that  $v - w \neq 0$  ( for if not,  $v \in U \Rightarrow v + U = 0 + U$  is not an eigvec ). □

**36** Prove or give a counterexample:

The result of (b) in Exercise 35 is still true if  $V$  is infinite-dim.

**SOLUTION:** A counterexample:

Consider  $V = \text{span}(1, e^x, e^{2x}, \dots)$  in  $\mathbb{R}^{\mathbb{R}}$ , and a subsp  $U = \text{span}(e^x, e^{2x}, \dots)$  of  $V$ .

Define  $T \in \mathcal{L}(V)$  by  $Tf = e^x f$ . Then  $\text{range } T = U$  is invar under  $T$ .

Consider  $(T/U)(1 + U) = e^x + U = 0$

$\Rightarrow 0$  is an eigval of  $T/U$  but is not an eigval of  $T$ .

(  $\text{null } T = \{0\}$ , for if not,  $\exists f \in V \setminus \{0\}$ ,  $(Tf)(x) = e^x f(x) = 0, \forall x \in \mathbf{R} \Rightarrow f = 0$ , contradicts. ) □

**33** Suppose  $T \in \mathcal{L}(V)$ . Prove that  $T/(\text{range } T) = 0$ .

**SOLUTION:**

$\forall v + \text{range } T \in V/\text{range } T, v + \text{range } T \in \text{null } (T/(\text{range } T))$

$\Rightarrow \text{null } (T/(\text{range } T)) = V/\text{range } T \Rightarrow T/(\text{range } T)$  is a zero map. □

**34** Suppose  $T \in \mathcal{L}(V)$ . Prove that  $T/(\text{null } T)$  is inje  $\iff (\text{null } T) \cap (\text{range } T) = \{0\}$ .

**SOLUTION:**

(a) Suppose  $T/(\text{null } T)$  is inje.

Then  $(T/(\text{null } T))(u + \text{null } T) = Tu + \text{null } T = 0$

$\iff Tu \in \text{null } T \text{ 又 } Tu \in \text{range } T \iff u + \text{null } T = 0 \iff u \in \text{null } T \iff Tu = 0$ .

Thus  $(\text{null } T) \cap (\text{range } T) = \{0\}$ .

(b) Suppose  $(\text{null } T) \cap (\text{range } T) = \{0\}$ .

$\iff Tu \in \text{null } T \text{ 又 } Tu \in \text{range } T \iff Tu = 0 \iff u \in \text{null } T \iff u + \text{null } T = 0$ .

Thus  $T/(\text{null } T)$  is inje. □

Prove that  $\dim \mathcal{E}$  equals the degree of the mini poly of  $T$ .

**SOLUTION:**

Because the list  $(I, T, \dots, T^{(\dim V)^2})$  of length  $\dim \mathcal{L}(V) + 1$  is linely depe in  $\dim \mathcal{L}(V)$ .

Suppose  $m \in \mathbb{N}^+$  is the smallest such that  $T^m = a_0 I + \dots + a_{m-1} T^{m-1}$ .

Then  $q$  defined by  $q(z) = z^m - a_{m-1} z^{m-1} - \dots - a_0$  is the mini poly ( see [8.40] ).

For any  $k \in \mathbb{N}^+$ ,  $T^{m+k} = T^k(T^m) \in \text{span}(I, T, \dots, T^{m-1}) = U$ .

Hence  $\text{span}(I, T, \dots, T^{(\dim V)^2}) = \text{span}(I, T, \dots, T^{(\dim V)^2-1}) = U$ .

Note that by the minimality of  $m$ ,  $(I, T, \dots, T^{m-1})$  is linely inde.

Thus  $\dim U = m = \dim \text{span}(I, T, \dots, T^{(\dim V)^2-1}) = \dim \text{span}(I, T, \dots, T^n)$  for all  $m < n \in \mathbb{N}^+$ .

Prove that  $\exists ! r \in \mathcal{P}(\mathbb{F})$  such that  $q(T) = r(T)$ ,  $\deg r < \deg p$ .

**SOLUTION:**

If  $\deg q < \deg p$ , then we are done.

If  $\deg q = \deg p$ , notice that  $p(T) = 0 = c_0I + c_1T + \cdots + c_{m-1}T^{m-1} + T^m$

$$\Rightarrow T^m = -c_0I - c_1T - \cdots - c_{m-1}T^{m-1},$$

$$\begin{aligned} \text{define } r \text{ by } r(z) &= q(z) + [-a_m z^m + a_m(-c_0 - c_1 z - \cdots - c_{m-1} z^{m-1})] \\ &= (a_0 - a_m c_0) + (a_1 - a_m c_1)z + \cdots + (a_{m-1} - a_m c_{m-1})z^{m-1}, \end{aligned}$$

hence  $r(T) = 0$ ,  $\deg r < m$  and we are done.

Now suppose  $\deg q \geq \deg p$ . We use induction on  $\deg q$ .

(i)  $\deg q = \deg p$ , then the desired result is true, as shown above.

(ii)  $\deg q > \deg p$ , assume that the desired result is true for  $\deg q = n$ .

Suppose  $f \in \mathcal{P}(\mathbf{F})$  such that  $f(z) = b_0 + b_1 z + \cdots + b_n z^n + b_{n+1} z^{n+1}$ .

Apply the assumption to  $g$  defined by  $g(z) = b_0 + b_1 z + \cdots + b_n z^n$ ,

getting  $s$  defined by  $s(z) = d_0 + d_1 z + \cdots + d_{m-1} z^{m-1}$ .

Thus  $g(T) = s(T) \Rightarrow f(T) = g(T) + b_{n+1} T^{n+1} = s(T) + b_{n+1} T^{n+1}$ .

Apply the assumption to  $t$  defined by  $t(z) = z^n$ ,

getting  $\delta$  defined by  $\delta(z) = c_0' + c_1' z + \cdots + c_{m-1}' z^{m-1}$ .

Thus  $t(T) = T^n = c_0' + c_1' T + \cdots + c_{m-1}' T^{m-1} = \delta(T)$ .

$\text{span}(v, Tv, \dots, T^{m-1}v)$  is invar under  $T$ .

Hence  $\exists ! k_j \in \mathbf{F}, T^{n+1} = T(T^n) = k_0 + k_1 T + \cdots + k_{m-1} T^{m-1}$ .

And  $f(T) = s(T) + b_{n+1}(k_0 + k_1 T + \cdots + k_{m-1} T^{m-1})$

$\Rightarrow f(T) = (d_0 + k_0) + (d_1 + k_1)z + \cdots + (d_{m-1} + k_{m-1})z^{m-1} = h(T)$ , thus defining  $h$ . □

- (4E 5.B.14) Suppose  $V$  is finite-dim,  $T \in \mathcal{L}(V)$  has mini poly  $p$  defined by  $p(z) = a_0 + a_1 z + \cdots + a_{m-1} z^{m-1} + z^m, a_0 \neq 0$ . Find the mini poly of  $T^{-1}$ .

**SOLUTION:**

Notice that  $V$  is finite-dim. Then  $p(0) = a_0 \neq 0 \Rightarrow 0$  is not a zero of  $p \Rightarrow T - 0I = T$  is inv.

Then  $p(T) = a_0 I + a_1 T + \cdots + T^m = 0$ . Apply  $T^{-m}$  to both sides,

We now show that  $(T^{-1})^k \notin \text{span}(I, T^{-1}, \dots, (T^{-1})^{k-1})$

for every  $k \in \{1, \dots, m-1\}$  by contradiction, so that  $q$  is exactly the mini poly of  $T^{-1}$ .

Suppose  $(T^{-1})^k \in \text{span}(I, T^{-1}, \dots, (T^{-1})^{k-1})$ .

Then let  $(T^{-1})^k = b_0 I + b_1 T^{-1} + \cdots + b_{k-1} T^{k-1}$ . Apply  $T^k$  to both sides,

getting  $I = b_0 T^k + b_1 T^{k-1} + \cdots + b_{k-1} T$ , hence  $T^k \in \text{span}(I, T, \dots, T^{k-1})$ .

Thus  $f$  defined by  $f(z) = z^k + \frac{b_1}{b_0} z^{k-1} + \cdots + \frac{b_{k-1}}{b_0} z - \frac{1}{b_0}$  is a poly multi of  $p$ .

### • COMMENT:

A nonzero poly has at most as many distinct zeros as its degree ( see [4.12] ).

Thus by the upper bound for the deg of mini poly given in NOTE FOR[8.40], and by [8.49,] we can give an alternative proof of [5.13]

• NOTICE ( See also 4E 5.B.20,24 )

Suppose  $\alpha_1, \dots, \alpha_n$  are all the distinct eigvals of  $T$ ,  
and therefore are all the distinct zeros of the mini poly.

Also, the mini poly of  $T$  is a poly multi of, but not equal to,  $(z - \alpha_1) \cdots (z - \alpha_n)$ .

If we define  $q$  by  $q(z) = (z - \alpha_1)^{\dim V - (n-1)} \cdots (z - \alpha_n)^{\dim V - (n-1)}$ ,

then  $q$  is a poly multi of the char poly ( see [8.34] and [8.26] )

( Because  $\dim V > n$  and  $n - 1 > 0$ ,  $n[\dim V - (n - 1)] > \dim V$ . )

The char poly has the form  $(z - \alpha_1)^{\gamma_1} \cdots (z - \alpha_n)^{\gamma_n}$ , where  $\gamma_1 + \cdots + \gamma_n = \dim V$ .

The mini poly has the form  $(z - \alpha_1)^{\delta_1} \cdots (z - \alpha_n)^{\delta_n}$ , where  $0 \leq \delta_1 + \cdots + \delta_n \leq \dim V$ .

Hence  $q_i(T)v = q_i(\lambda)v \Rightarrow (T - \lambda_i I)^{\alpha_i} v = (\lambda - \lambda_i)^{\alpha_i} v$ .

So that  $(T - \lambda_1 I)^{\alpha_1} \cdots (T - \lambda_m I)^{\alpha_m} v$

$$\begin{aligned} &= q_1(T) \left( q_2(T) \left( \cdots (q_m(T)v) \cdots \right) \right) \\ &= q_1(\lambda) (q_2(\lambda) (\cdots (q_m(\lambda)v) \cdots)) \\ &= (\lambda - \lambda_1)^{\alpha_1} \cdots (\lambda - \lambda_m)^{\alpha_m} v. \end{aligned}$$

**8** [OR (4E 5.A.31)] Give an example of  $T \in \mathcal{L}(\mathbf{R}^2)$  such that  $T^4 = -I$ .

**SOLUTION:**

$T^4 + 1 = (T^2 + iI)(T^2 - iI) = (T + i^{1/2}I)(T - i^{1/2}I)(T - (-i)^{1/2}I)(T + (-i)^{1/2}I)$ .

Note that  $i^{1/2} = \frac{\sqrt{2}}{2} + i\frac{\sqrt{2}}{2}$ ,  $(-i)^{1/2} = \frac{\sqrt{2}}{2} - i\frac{\sqrt{2}}{2}$ . Hence  $T = \pm(\pm i)^{1/2}I$ .

Define  $T$  by  $T(x, y) = (\frac{\sqrt{2}}{2}x - \frac{\sqrt{2}}{2}y, \frac{\sqrt{2}}{2}x + \frac{\sqrt{2}}{2}y)$ .

$$\mathcal{M}(T) = \begin{pmatrix} \cos(-\pi/4) & \sin(-\pi/4) \\ -\sin(-\pi/4) & \cos(-\pi/4) \end{pmatrix} \Rightarrow \mathcal{M}(T)^4 = \mathcal{M}(T^4) = \begin{pmatrix} \cos(-\pi) & \sin(-\pi) \\ -\sin(-\pi) & \cos(-\pi) \end{pmatrix} = \begin{pmatrix} -1 & 0 \\ 0 & -1 \end{pmatrix} = -\mathcal{M}(I). \quad \square$$

**SOLUTION:**

$T(x_1, \dots, 0) = \text{By (5.A.9) and [8.49], } 1, 2, \dots, n \text{ are zeros of the mini poly of } T.$

( $\times$  Each eigvals of  $T$  corresponds to exact one-dim subsp of  $\mathbf{F}^n$ .)

Define a poly  $q$  by  $q(z) = (z-1)(z-2)\cdots(z-n)$ , for all  $z \in \mathbf{F}$ . (Then  $q$  is the char poly of  $T$ .)

Because  $q(T)e_j = [(T-I)\cdots(T-(j-1)I)(T-(j+1)I)\cdots(T-nI)](T-jI)e_j = 0$  for each  $j$ , where  $(e_1, \dots, e_n)$  is the standard basis. Thus  $\forall v \in \mathbf{F}^n, q(T)v = 0$ . Hence  $q$  is the mini poly of  $T$ .  $\square$

Suppose  $T \in \mathcal{L}(\mathbf{R}^2)$  is the operator of counterclockwise rotation by  $\theta$ , where  $\theta \in \mathbf{R}^+$ . Find the mini poly of  $T$ .

**SOLUTION:**

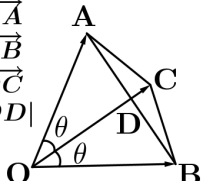

If  $\theta = \pi + 2k\pi$ , then  $T(w, z) = (-w, -z), T^2 = I$  and the mini poly is  $z + 1$ .

If  $\theta = 2k\pi$ , then  $T = I$  and the mini poly is  $z - 1$ .

Now suppose  $(v, Tv)$  is linely inde. Then  $\text{span}(v, Tv) = \mathbf{R}^2$ .

Suppose the mini poly  $p$  is defined by  $p(z) = z^2 + bz + c$  for all  $z \in \mathbf{R}$ .

Because

$$\begin{aligned} T^2 \vec{v} &= \vec{OA} \\ \vec{v} &= \vec{OB} \\ T \vec{v} &= \vec{OC} \\ L &= |\vec{OD}| \end{aligned}$$

$$\begin{aligned} Tv &= \frac{|\vec{v}|}{2L} (T^2v + v) \Rightarrow T = \frac{|\vec{v}|}{2L} (T^2 + I) \\ L &= |\vec{v}| \cos \theta \Rightarrow \frac{|\vec{v}|}{2L} = \frac{1}{2 \cos \theta} \end{aligned}$$

Hence  $p(T) = T^2 - 2 \cos \theta T + I = 0$  and  $z^2 - 2 \cos \theta z + 1$  is the mini poly of  $T$ .  $\square$

OR. By (4E 5.B.11),  $\mathcal{M}(T, (e_1, e_2)) = \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix}$ .

Hence the mini poly is  $z \pm 1$  or  $z^2 - 2 \cos \theta z + 1$ .  $\square$

(a) Show that  $T^2 - (a+d)T + (ad-bc)I = 0$ .

(b) Show that the mini poly of  $T$  equals

$$\begin{cases} z - a & \text{if } b = c = 0 \text{ and } a = d, \\ z^2 - (a + d)z + (ad - bc) & \text{otherwise.} \end{cases}$$

**SOLUTION:**

(a) Suppose the basis is  $(v, w)$ . Because  $\begin{cases} Tv = av + bw \Rightarrow (T - aI)v = bw, \text{ then apply } (T - dI) \text{ to both sides} \\ Tw = cv + dw \Rightarrow (T - dI)w = cv, \text{ then apply } (T - aI) \text{ to both sides} \end{cases}$

$$\text{Hence } (T - aI)(T - dI) = bcI \Rightarrow T^2 - (a + d)T + (ad - bc)I = 0.$$

(b) If  $b = c = 0$  and  $a = d$ . Then  $\mathcal{M}(T) = \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix} = a\mathcal{M}(I)$ . Thus  $T = aI$ . Hence the mini poly is  $z - a$ .

Otherwise, by (a),  $z^2 - (a + d)z + (ad - bc)$  is a poly multi of the mini poly.

$$\text{Then } (TS)^{m+1} = (TS)^m(TS) = S^{-1}(ST)^m STS = S^{-1}(ST)^{m+1} S.$$

**SOLUTION:**

Let  $(v_1, \dots, v_n)$  denote the basis such that  $\mathcal{M}(T, (v_1, \dots, v_n))_{j,k} = A_{j,k} \in \mathbb{Q}$  for all  $j, k = 1, \dots, n$ .

Denote  $\mathcal{M}(v_j, (v_1, \dots, v_n))$  by  $x_j$  for each  $v_j$ .

Suppose  $p$  is the mini poly of  $T$  and  $p(z) = z^m + \dots + c_1 z + c_0$ . Now we show that each  $c_j \in \mathbb{Q}$ .

Note that  $\forall s \in \mathbb{N}^+, \mathcal{M}(T^s) = \mathcal{M}(T)^s = A^s \in \mathbb{Q}^{n,n}$  and  $T^s v_k = A_{1,k}^s v_1 + \dots + A_{n,k}^s v_n$  for all  $k \in \{1, \dots, n\}$ .

$$\text{Thus } \begin{cases} \mathcal{M}(p(T)v_1) = (A^m + \dots + c_1 A + c_0 I)x_1 = \sum_{j=1}^n (A^m + \dots + c_1 A + c_0 I)_{j,1} x_j = 0; \\ \vdots \\ \mathcal{M}(p(T)v_n) = (A^m + \dots + c_1 A + c_0 I)x_n = \sum_{j=1}^n (A^m + \dots + c_1 A + c_0 I)_{j,n} x_j = 0; \end{cases}$$

Show that the mini poly of  $T$  is  $p$  defined by  $p(z) = a_0 + a_1 z + \dots + a_{n-1} z^{n-1} + z^n$ .

$\mathcal{M}(T)$  is called the **companion matrix** of the poly above. This exercise shows that every monic poly is the mini poly of some operator.

Hence a formula or an algorithm that could produce exact eigvals for each operator on each  $\mathbb{F}^n$  could then produce exact zeros for each poly [ by 8.36(b) ]. Thus there is no such formula or algorithm. However, efficient numeric methods exist for obtaining very good approximations for the eigvals of an operator.

**SOLUTION:** Note that  $(e_1, Te_1, \dots, T^{n-1}e_1)$  is linely inde. 又 The deg of mini poly is at most  $n$ .

Suppose  $\mathbb{F} = \mathbb{R}$ ,  $V$  is finite-dim,  $T \in \mathcal{L}(V)$  and  $b, c \in \mathbb{R}$  with  $b^2 < 4c$ .

Prove that  $\dim \text{null}(T^2 + bT + cI)$  is an even number.

**SOLUTION:**

Denote  $\text{null}(T^2 + bT + cI)$  by  $R$ . Then  $T|_R + bT|_R + cI_R = (T + bT + cI)|_R = 0 \in \mathcal{L}(R)$ .

Suppose  $\lambda$  is an eigval of  $T_R$  with an eigvec  $v \in R$ .

$$\text{Then } 0 = (T|_R^2 + bT|_R + cI_R)(v) = (\lambda^2 + \lambda b + c)v = ((\lambda + b)^2 + c - \frac{b^2}{4})v.$$

Because  $c - \frac{b^2}{4} > 0$  and we have  $v = 0$ . Thus  $T_R$  has no eigvals.

Let  $U$  be an invar subsp of  $R$  that has the largest, even dim among all invar subsp.

Assume that  $U \neq R$ . Then  $\exists w \in R$  but  $w \notin U$ . Let  $W$  be such that  $(w, T|_R w)$  is a basis of  $W$ .

Because  $T|_R^2 w = -bT|_R w - cw \in W$ . Hence  $W$  is an invar subsp of dim 2.

Thus  $\dim(U + W) = \dim U + 2 - \dim(U \cap W)$ , where  $U \cap W = \{0\}$ ,

for if not, because  $w \notin U, T|_R w \in U$ ,

$U \cap W$  is invar under  $T|_R$  of one dim ( impossible because  $T|_R$  has no eigvecs ).

Hence  $U + W$  is even-dim invar subsp under  $T|_R$ , contradicting the maximality of  $\dim U$ .

Thus the assumption was incorrect. Hence  $R = \text{null}(T^2 + bT + cI) = U$  has even dim. □

• OPERATORS ON ODD-DIMENSIONAL VECTOR SPACES HAVE EIGENVALUES

(a) Suppose  $\mathbf{F} = \mathbf{C}$ . Then by [5.21], we are done.

(b) Suppose  $\mathbf{F} = \mathbf{R}$ ,  $V$  is finite-dim, and  $\dim V = n$  is an odd number.

Let  $T \in \mathcal{L}(V)$  and the mini poly is  $p$ . Prove that  $T$  has an eigval.

SOLUTION:

(i) If  $n = 1$ , then we are done.

(ii) Suppose  $n \geq 3$ . Assume that every operator, on odd-dim vecsp of dim less than  $n$ , has an eigval.

If  $p$  is a poly multi of  $(x - \lambda)$  for some  $\lambda \in \mathbf{R}$ , then by [8.49]  $\lambda$  is an eigval of  $T$  and we are done.

Now suppose  $b, c \in \mathbf{R}$  such that  $b^2 < 4c$  and  $p$  is a poly multi of  $x^2 + bx + c$  (see [4.17]).

Then  $\exists q \in \mathcal{P}(\mathbf{R})$  such that  $p(x) = q(x)(x^2 + bx + c)$  for all  $x \in \mathbf{R}$ .

Now  $0 = p(T) = (q(T))(T^2 + bT + cI)$ , which means that  $q(T)|_{\text{range}(T^2 + bT + cI)} = 0$ .

Because  $\deg q < \deg p$  and  $p$  is the mini poly of  $T$ , hence  $\text{range}(T^2 + bT + cI) \neq V$ .

又  $\dim V$  is odd and  $\dim \text{null}(T^2 + bT + cI)$  is even ( by our previous result ).

Thus  $\dim V - \dim \text{null}(T^2 + bT + cI) = \dim \text{range}(T^2 + bT + cI)$  is odd.

By [5.18],  $\text{range}(T^2 + bT + cI)$  is an invar subsp of  $V$  under  $T$  that has odd dim less than  $n$ .

Our induction hypothesis now implies that  $T|_{\text{range}(T^2 + bT + cI)}$  has an eigval.

By mathematical induction. □

Prove that every invar subsp of  $V$  under  $T$  is even-dim.

SOLUTION:

Suppose  $U$  is such a subsp. Then  $T|_U \in \mathcal{L}(U)$ . We prove by contradiction.

If  $\dim U$  is odd, then  $T|_U$  has an eigval and so is  $T$ , so that  $\exists$  invar subsp of 1 dim, contradicts. □

• (4E 5.B.29) Show that every operator on a finite-dim vecsp of  $\dim \geq 2$  has a 2-dim invar subsp.

SOLUTION:

Using induction on  $\dim V$ .

(i)  $\dim V = 2$ , we are done.

(ii)  $\dim V > 2$ . Assume that the desired result is true for vecsp of smaller dim.

Suppose  $p$  is the mini poly of degree  $m$  and  $p(z) = (z - \lambda_1) \cdots (z - \lambda_m)$ .

If  $T = \lambda I$  (  $\Leftrightarrow m = 1 \vee m = -\infty$  ), then we are done. (  $m \neq 0$  because  $\dim V \neq 0$  )

Now define a  $q$  by  $q(z) = (z - \lambda_1)(z - \lambda_2)$ .

By assumption,  $T|_{\text{null } q(T)}$  has an invar subsp of dim 2.

Prove that  $\exists$  a basis of  $V$  with resp to which
