简介

这是我个人用于复习的「Linear Algebra Done Right 3E/4E, by Sheldon Axler」笔记,一本习题选答与课文补注。因为使用中文会给我编撰这份笔记带来额外的中英文输入法切换的工作成本,况且对于专业学习者,直接使用英文不会造成任何困扰。但英文词句的冗长性拖慢我复习的效率,所以我对许多常用术语作了简写。这份笔记的内容范围和标识说明,我已经在自述中写得很清楚,不再赘述。这份笔记尚处于缓慢的编撰进度中。

我目前还没有能力和资格评论原书好坏以及线性代数课程教材选用的问题。但作为原书的学习者,我可以说,这本书作为初学线性代数的第一教材,虽然不需要其他辅助教材,但要求学习者有足够的耐心和毅力:课文一次看不懂就多看几遍,一天看不懂就分三天看;习题一个小时做不出来,隔六个小时再尝试,一天做不出来,就隔天再尝试。我虽然没有学过除此以外的其他任何线性代数教材,但我认为这样钻研原书是值得的。

1 Prove that $\forall v \in V, -(-v) = v$.

SOLUTION: $-(-v) = (-1)((-1)v) = ((-1)(-1))v = 1 \cdot v = v$.

2 Suppose $a \in \mathbb{F}$, $v \in V$, and av = 0. Prove that a = 0 or v = 0.

SOLUTION: Suppose $a \neq 0$, $\exists a^{-1} \in F$, $a^{-1}a = 1$, hence $v = 1 \cdot v = (a^{-1}a)v = a^{-1}(av) = a^{-1} \cdot 0 = 0$.

3 Suppose $v, w \in V$. Explain why $\exists ! x \in V, v + 3x = w$.

SOLUTION:
$$v + 3x = w \Leftrightarrow 3x = w - v \Leftrightarrow x = \frac{1}{3}(w - v)$$
.

Or. [Existns] Let $x = \frac{1}{3}(w - v)$.

[*Uniques*] If $v + 3x_1 = w$,(I) $v + 3x_2 = w$ (II). Then (I) - (II) $: 3(x_1 - x_2) = 0 \Rightarrow x_1 = x_2$.

5 Show that in the def of a vecsp, the add inv condition can be replaced by [1.29].

Hint: Suppose V satisfies all conds in the def, except we've replaced the add inv cond with [1.29]. Prove that the add inv is true.

Using [1.31].
$$0v = 0$$
 for all $v \in V \iff (1 + (-1))v = 1 \cdot v + (-1)v = v + (-v) = 0$.

6 Let ∞ and $-\infty$ denote two distinct objects, neither of which is in R.

Define an add and scalar multi on $R \cup \{\infty, -\infty\}$ as you could guess.

The operations of real numbers is as usual. While for $t \in R$ define

$$t\infty = \begin{cases} -\infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t > 0, \end{cases} \qquad t(-\infty) = \begin{cases} -\infty & \text{if } t > 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t < 0, \end{cases}$$

(I) $t + \infty = \infty + t = \infty + \infty = \infty$,

(II)
$$t + (-\infty) = (-\infty) + t = (-\infty) + (-\infty) = -\infty$$
,

(III)
$$\infty + (-\infty) = (-\infty) + \infty = 0.$$

With these operations of add and scalar multi, is $R \cup \{\infty, -\infty\}$ a vecsp over R? Explain.

SOLUTION: Not a vecpsp, since the add and scalar mult is not assoc and distr.

By Assoc:
$$(a + \infty) + (-\infty) \neq a + (\infty + (-\infty))$$
.

Or. By Distr: $\infty = (2 + (-1))\infty \neq 2\infty + (-\infty) = \infty + (-\infty) = 0$.

• Tips: About the Field **F**: Many choices.

Example: $\mathbf{F} = \mathbf{Z}_m = \{K_0, K_1, \dots, K_{m-1}\}, \forall m-1 \in \mathbf{N}^+$. [Using Euler's Theorem.]

• Note For [1.45]: If $\mathbf{F} = \{0, 1\}$. Prove that if U + W is a direct sum, then $U \cap W = \{0\}$.

Because $\forall v \in U \cap W, \exists ! (u, w) \in U \times W, v = u + w$.

If $U \cap W \neq \{0\}$, then (u, w) can be (v, 0) or (0, v), contradicts the uniques.

• TIPS 1: Suppose $U, W \subseteq V$. And U, W, V are vecsps ⇒ U, W are subsps of V . Then $U + W$ is also a subsp of V . Because $\forall u \in U, w \in U, u + w \in V$ since $u, w \in V$.	
7 Give a nonempty $U \subseteq \mathbb{R}^2$, U is closed under taking add invs and under add, but is not a subsp of \mathbb{R}^2 . Solution : $(0 \in U; v \in U \Rightarrow -v \in U$. And operations on U are the same as \mathbb{R}^2 . $)$ Let \mathbb{Z}^2 , \mathbb{Q}^2 .	
8 Give a nonempty $U \subseteq \mathbb{R}^2$, U is closed under scalar multi, but is not a subsp of \mathbb{R}^2 . S OLUTION: Let $U = \{(x,y) \in \mathbb{R}^2 : x = 0 \lor y = 0\}$.	
9 A function $f: \mathbb{R} \to \mathbb{R}$ is called periodic if $\exists p \in \mathbb{N}^+$, $f(x) = f(x+p)$ for all $x \in \mathbb{R}$. Is the set of periodic functions $\mathbb{R} \to \mathbb{R}$ a subsp of $\mathbb{R}^\mathbb{R}$? Explain.	
SOLUTION: Denote the set by S . Suppose $h(x) = \cos x + \sin \sqrt{2}x \in S$, since $\cos x$, $\sin \sqrt{2}x \in S$. Assume $\exists p \in \mathbb{N}^+$ such that $h(x) = h(x+p)$, $\forall x \in \mathbb{R}$. Let $x = 0 \Rightarrow h(0) = h(\pm p) = 1$. Thus $1 = \cos p + \sin \sqrt{2}p = \cos p - \sin \sqrt{2}p$ $\Rightarrow \sin \sqrt{2}p = 0$, $\cos p = 1 \Rightarrow p = 2k\pi$, $k \in \mathbb{Z}$, while $p = \frac{m\pi}{\sqrt{2}}$, $m \in \mathbb{Z}$.	
Hence $2k = \frac{m}{\sqrt{2}} \Rightarrow \sqrt{2} = \frac{m}{2k} \in \mathbb{Q}$. Contradiction! OR. Because $[I] : \cos x + \sin \sqrt{2}x = \cos(x+p) + \sin(\sqrt{2}x + \sqrt{2}p)$. By differentiating twice, $[II] : \cos x + 2\sin\sqrt{2}x = \cos(x+p) + 2\sin(\sqrt{2}x + \sqrt{2}p).$	
$[II] - [I] : \sin\sqrt{2}x = \sin\left(\sqrt{2}x + \sqrt{2}p\right)$ $2[I] - [II] : \cos x = \cos(x + p)$ $\Rightarrow \text{Let } x = 0, \ p = \frac{m\pi}{\sqrt{2}} = 2k\pi. \text{ Contradicts.}$	
$ 24 \text{ Let } V_E = \left\{ f \in \mathbf{R}^{\mathbf{R}} : f \text{ is even} \right\}, V_O = \left\{ f \in \mathbf{R}^{\mathbf{R}} : f \text{ is odd} \right\}. \text{ Show that } V_E \oplus V_O = \mathbf{R}^{\mathbf{R}}. $ Solution: (a) $V_E \cap V_O = \left\{ f \in \mathbf{R}^{\mathbf{R}} : f(x) = f(-x) = -f(-x) \right\} = \left\{ 0 \right\}. $ (b) $ \begin{vmatrix} \text{Let } f_e(x) = \frac{1}{2} \left[g(x) + g(-x) \right] \implies f_e \in V_E \\ \text{Let } f_o(x) = \frac{1}{2} \left[g(x) - g(-x) \right] \implies f_o \in V_O \end{vmatrix} \Rightarrow \forall g \in \mathbf{R}^{\mathbf{R}}, \ g(x) = f_e(x) + f_o(x). $	
• Suppose U, W, V_1, V_2, V_3 are subsps of V .	

15
$$U + U \ni u + w \in U$$
. **16** $U + W \ni u + w = w + u \in W + U$. \square
17 $(V_1 + V_2) + V_3 \ni (v_1 + v_2) + v_3 = v_1 + (v_2 + v_3) \in V_1 + (V_2 + V_3)$. \square
• $(U + W)_C \ni (u_1 + w_1) + i(u_2 + w_2) = (u_1 + iu_2) + (w_1 + iw_2) \in U_C + W_C$. \square

18 Does the add on the subsps of V have an add identity? Which subsps have add invs? **Solution**: Suppose Ω is the unique add identity.

- (a) For any subsp U of V. $\Omega \subseteq U + \Omega = U \Rightarrow \Omega \subseteq U$. Let $U = \{0\}$, then $\Omega = \{0\}$.
- (b) Now suppose W is an add inv of $U \Rightarrow U + W = \Omega$.

Note that
$$U + W \supseteq U, W \Rightarrow \Omega \supseteq U, W$$
. Thus $U = W = \Omega = \{0\}$.

11 Prove that the intersection of every collection of subsps of V is a subsp of V . SOLUTION : Suppose $\{U_{\alpha}\}_{{\alpha}\in\Gamma}$ is a collection of subsps of V ; here Γ is an index set.
We show that $\bigcap_{\alpha \in \Gamma} U_{\alpha}$, which equals the set of vecs that are in U_{α} for each $\alpha \in \Gamma$, is a subsp of V . (—) $0 \in \bigcap_{\alpha \in \Gamma} U_{\alpha}$. Nonempty.
$(\equiv) u, v \in \bigcap_{\alpha \in \Gamma} U_{\alpha} \Rightarrow u + v \in U_{\alpha}, \ \forall \alpha \in \Gamma \Rightarrow u + v \in \bigcap_{\alpha \in \Gamma} U_{\alpha}.$ Closed under add. $(\equiv) u \in \bigcap_{\alpha \in \Gamma} U_{\alpha}, \lambda \in \Gamma \Rightarrow \lambda u \in U_{\alpha}, \ \forall \alpha \in \Gamma \Rightarrow \lambda u \in \bigcap_{\alpha \in \Gamma} U_{\alpha}.$ Closed under scalar multi.
Thus $\bigcap_{\alpha \in \Gamma} U_{\alpha}$ is nonempty subset of V that is closed under add and scalar multi.
12 Suppose U , W are subsps of V . Prove that $U \cup W$ is a subsp of $V \iff U \subseteq W$ or $W \subseteq U$.
SOLUTION: (a) Suppose $U \subseteq W$. Then $U \cup W = W$ is a subsp of V .
(b) Suppose $U \cup W$ is a subsp of V . Assume that $U \nsubseteq W$, $U \not\supseteq W$ ($U \cup W \neq U$ and W). Then $\forall a \in U \land a \notin W$, $\forall b \in W \land b \notin U$, we have $a + b \in U \cup W$.
$a+b \in U \Rightarrow b=(a+b)+(-a) \in U$, contradicts $\Rightarrow W \subseteq U$. Contradicts the
$a+b \in W \Rightarrow a = (a+b)+(-b) \in W$, contradicts $\Rightarrow U \subseteq W$. assumption.
13 Prove that the union of three subsps of V is a subsp of V
if and only if one of the subsps contains the other two.
This exercise is not true if we replace F with a field containing only two elements. Solution:
Suppose U_1, U_2, U_3 are subsps of V . Denote $U_1 \cup U_2 \cup U_3$ by \mathcal{U} .
(a) Suppose that one of the subsps contains the other two.
Then $\mathcal{U} = U_1, U_2$ or U_3 is a subsp of V .
(b) Suppose that $U_1 \cup U_2 \cup U_3$ is a subsp of V .
Distinctively notice that $A \cup B \cup C = (A \cup B) \cup (B \cup C) = (A \cup C) \cup (B \cup C) = (A \cup B) \cup (A \cup C)$. Also note that, if $U \cup W = V$ is a vecsp, then in general U and W are not subsps of V . Hence this literal trick is invalid.
(I) If any U_i is contained in the union of the other two, say $U_1 \subseteq U_2 \cup U_3$, then $\mathcal{U} = U_2 \cup U_3$.
By applying Problem (12) we conclude that one U_j contains the other two. Thus we are done.
(II) Assume that no U_j is contained in the union of the other two,
and no U_j contains the union of the other two. Say $U_1 \nsubseteq U_2 \cup U_3$ and $U_1 \nsupseteq U_2 \cup U_3$.
$\exists u \in U_1 \land u \notin U_2 \cup U_3; \ v \in U_2 \cup U_3 \land v \notin U_1. \text{ Let } W = \{v + \lambda u : \lambda \in F\} \subseteq \mathcal{U}.$
Note that $W \cap U_1 = \emptyset$, for if any $v + \lambda u \in W \cap U_1$ then $v + \lambda u - \lambda u = v \in U_1$.
Now $W \subseteq U_1 \cup U_2 \cup U_3 \Rightarrow W \subseteq U_2 \cup U_3$. $\forall v + \lambda u \in W, v + \lambda u \in U_i, i = 2, 3$.
If $U_2 \subseteq U_3$ or $U_2 \supseteq U_3$, then $\mathcal{U} = U_1 \cup U_i$, $i = 2, 3$. By Problem (12) we are done.
Otherwise, both $U_2, U_3 \neq \{0\}$. Because $W \subseteq U_2 \cup U_3$ has at least three elements.
There must be some U_i that contains at least two elements of W .
$\exists \text{ distinct } \lambda_1, \lambda_2 \in \mathbf{F}, v + \lambda_1 u, v + \lambda_2 u \in U_i, i \in \{2, 3\}.$
Then $u \in U_i$ while $u \notin U_2 \cup U_3$. Contradicts.
EXAMPLE: Let $\mathbf{F} = \mathbf{Z}_2$. $U_1 = \{u, 0\}$, $U_2 = \{v, 0\}$, $U_3 = \{v + u, 0\}$. While $\mathcal{U} = \{0, u, v, v + u\}$ is a subsp.

• Example: Suppose $U = \{(x, x, y, y) \in \mathbb{F}^4\}, W = \{(x, x, x, y) \in \mathbb{F}^4\}.$ Prove that $U + W = \{(x, x, y, z) \in \mathbb{F}^4\}.$ Let T denote $\{(x, x, y, z) \in \mathbb{F}^4 : x, y, z \in \mathbb{F}\}$. By def, $U + W \subseteq T$. And $T \ni (x, x, y, z) \Rightarrow (0, 0, y - x, y - x) + (x, x, x, -y + x + z) \in U + W$. Hence $T \subseteq U + W$. **21** Suppose $U = \{(x, y, x + y, x - y, 2x) \in \mathbb{F}^5\}$. Find a W such that $\mathbb{F}^5 = U \oplus W$. **SOLUTION**: Let $W = \{(0, 0, z, w, u) \in \mathbb{F}^5\}$. Then $U \cap W = \{0\}$. And $F^5 \ni (x, y, z, w, u) \Rightarrow (x, y, x + y, x - y, 2x) + (0, 0, z - x - y, w - x - y, u - 2x) \in U + W$. **23** Give an example of vecsps V_1 , V_2 , U such that $V_1 \oplus U = V_2 \oplus U$, but $V_1 \neq V_2$. **Solution**: $V = \mathbf{F}^2$, $U = \{(x, x) \in \mathbf{F}^2\}$, $V_1 = \{(x, 0) \in \mathbf{F}^2\}$, $V_2 = \{(0, x) \in \mathbf{F}^2\}$. • Tips 2: Suppose $V_1 \subseteq V_2$ in Exercise (23). Prove that $V_1 = V_2$. **SOLUTION:** Because the subset V_1 of vecsp V_2 is closed under add and scalar multi, V_1 is a subspace of V_2 . Suppose W is such that $V_2 = V_1 \oplus W$. Now $V_2 \oplus U = (V_1 \oplus W) \oplus U = (V_1 \oplus U) \oplus W = V_1 \oplus U$. If $W \neq \{0\}$, then $V_1 \oplus U \subsetneq (V_1 \oplus U) \oplus W$, contradicts. Hence $W = \{0\}$, $V_1 = V_2$. • Suppose V_1, V_2, U_1, U_2 are vecsps, $V_1 \oplus U_1 = V_2 \oplus U_2, V_1 \subseteq V_2, U_2 \subseteq U_1$. *Prove or give a counterexample:* $V_1 = V_2$, $U_1 = U_2$. **SOLUTION:** Let $U_2 = \{0\}$. Give an example that each of V_1, V_2, U_1 is nonzero. • Tips 3: Suppose the intersection of any two of the vecsps U, W, X, Y is $\{0\}$. Give an example that $(X \oplus U) \cap (Y \oplus W) \neq \{0\}$. **SOLUTION**: Using notations in Chapter 2. Let $B_X = (e_1)$, $B_U = (e_2 - e_1)$, $B_Y = ()$, $B_W = (e_2)$. • Tips 4: Let V = U + W, $I = U \cap W$, $U = I \oplus X$, $W = I \oplus Y$. Prove that $V = I \oplus (X \oplus Y)$. **SOLUTION:** We show that $X \cap Y = U \cap Y = W \cap X = \{0\}$ by contradiction. $X \cap Y = \Delta \neq \{0\} \Rightarrow I = U \cap W \supseteq \Delta \Rightarrow I \cap X \neq \{0\}, I \cap Y \neq \{0\}.$ $U \cap Y = \Delta \neq \{0\} \Rightarrow I = U \cap W \supseteq \Delta \Rightarrow I \cap Y \neq \{0\}$. Similar for $W \cap X$. Thus $I + (X + Y) = (I \oplus X) \oplus Y = I \oplus (X \oplus Y)$. Now we show that V = I + (X + Y). $\forall v \in V, v = u + w, \exists (u, w) \in U \times W$ $\Rightarrow \exists (i_u, x_u) \in I \times X, (i_w, y_w) \in I \times Y, v = (i_u + i_w) + x_u + y_w \in I + (X + Y).$

Step 1 Pick a $v_1 \neq 0$, (v_1) linely inde. Step m Pick a $v_m \notin \text{span}(v_1, ..., v_{m-1})$, by Problem (11), $(v_1, ..., v_m)$ is linely inde. This process recursively defines the desired sequence $(v_1, v_2, ...)$. $\neg P \Rightarrow \neg Q$: Suppose *V* is finite-dim and $V = \text{span}(w_1, ..., w_m)$. Let $(v_1, v_2, ...)$ be a sequence in V, then $(v_1, v_2, ..., v_{m+1})$ must be linely dep. Or. $Q \Rightarrow P$: Suppose there is such a sequence. Choose an m. Suppose a linely inde list $(v_1, ..., v_m)$ spans V. Similar to [2.16]. $\exists v_{m+1} \in V \setminus \text{span}(v_1, \dots, v_m)$. Hence no list spans V. **16** Prove that the vecsp of all continuous functions in $\mathbb{R}^{[0,1]}$ is infinite-dim. **SOLUTION**: Denote the vecsp by U. Choose one $m \in \mathbb{N}^+$. Suppose $a_0, \dots, a_m \in \mathbb{R}$ are such that $p(x) = a_0 + a_1 x + \dots + a_m x^m = 0$, $\forall x \in [0, 1]$. Then *p* has infinitely many roots and hence each $a_k = 0$, otherwise deg $p \ge 0$, contradicts [4.12]. Thus $(1, x, ..., x^m)$ is linely inde in $\mathbb{R}^{[0,1]}$. Similar to [2.16], U is infinite-dim. Or. Note that $\frac{1}{1} > \frac{1}{2} > \dots > \frac{1}{m}$, $\forall m \in \mathbb{N}^+$. Hence $f_{m+1} \notin \operatorname{span}(f_1, \dots, f_m)$. By Problem (14). **17** Suppose $p_0, p_1, \dots, p_m \in \mathcal{P}_m(\mathbf{F})$ such that $p_k(2) = 0$ for each $k \in \{0, \dots, m\}$. *Prove that* $(p_0, p_1, ..., p_m)$ *is not linely inde in* $\mathcal{P}_m(\mathbf{F})$. **SOLUTION:** Suppose $(p_0, p_1, ..., p_m)$ is linely inde. Hence $(p_0, p_1, ..., p_m)$ is linely depe in $\mathcal{P}_m(\mathbf{F})$. For if not, then because $(1, z, ..., z^m)$ of length (m + 1) spans $\mathcal{P}_m(\mathbf{F})$, by the steps in [2.23] trivially, $(p_0, p_1, ..., p_m)$ of length (m + 1) spans $\mathcal{P}_m(\mathbf{F})$. Contradicts. OR. Note that $\mathcal{P}_m(\mathbf{F}) = \operatorname{span}(\underbrace{1, z, \ldots, z^m}_{\text{of length }(m+1)})$. Then $(p_0, p_1, \ldots, p_m, z)$ of length (m+2) is linely dep. As shown above, $z \notin \text{span}(p_0, p_1, \dots, p_m)$. And hence by [2.21](a), (p_0, p_1, \dots, p_m) is linely dep.

7 Prove or give a counterexample: If (v_1, v_2, v_3, v_4) is a basis of V and U is a subsp of V such that $v_1, v_2 \in U$ and $v_3 \notin U$ and $v_4 \notin U$, then (v_1, v_2) is a basis of U. **SOLUTION:** A counterexample: Let $V = \mathbb{R}^4$ and $B_V = (e_1, e_2, e_3, e_4)$ be std basis.

Let $v_1 = e_1, v_2 = e_2, v_3 = e_3 + e_4, v_4 = e_4$. Then $(v_1, ..., v_4)$ is a basis of \mathbb{R}^4 .

Let $U = \operatorname{span}(e_1, e_2, e_3) = \operatorname{span}(v_1, v_2, v_3 - v_4)$. Then $v_3 \notin U$ and (v_1, v_2) is not a basis of U.

• Note For " $C_V U \cup \{0\}$ ": " $C_V U \cup \{0\}$ " is supposed to be a subsp W such that $V = U \oplus W$.

But if we let $u \in U \setminus \{0\}$ and $w \in W \setminus \{0\}$, then $\begin{cases} w \in \mathbf{C}_V U \cup \{0\} \\ u \pm w \in \mathbf{C}_V U \cup \{0\} \end{cases} \end{cases} \Rightarrow u \in \mathbf{C}_V U \cup \{0\}$. Contradicts.

To fix this, denote the set $\{W_1, W_2, \cdots\}$ by $S_V U$, where for each W_i , $V = U \oplus W_i$. See also in (1.C.23).

• Tips: Suppose V is finite-dim with dim V=n and U is a subsp of V with $U\neq V$. Prove that $\exists B_V=(v_1,\ldots,v_n)$ such that each $v_k\notin U$.

Note that $U \neq V \Rightarrow n \geqslant 1$. We will construct B_V via the following process.

Step 1. $\exists v_1 \in V \setminus U \Rightarrow v_1 \neq 0$. If span $(v_1) = V$ then we stop.

Step k. Suppose $(v_1, ..., v_{k-1})$ is linely inde in V, each of which belongs to $V \setminus U$.

Note that $\operatorname{span}(v_1, \dots, v_{k-1}) \neq V$. And if $\operatorname{span}(v_1, \dots, v_{k-1}) \cup U = V$, then by (1.C.12),

[because span $(v_1, \dots, v_{k-1}) \nsubseteq U$,] $U \subseteq \text{span}(v_1, \dots, v_{k-1}) \Rightarrow \text{span}(v_1, \dots, v_{k-1}) = V$.

Hence because span $(v_1, \dots, v_{k-1}) \neq V$, it must be case that span $(v_1, \dots, v_{k-1}) \cup U \neq V$.

Thus $\exists v_k \in V \setminus U$ such that $v_k \notin \text{span}(v_1, \dots, v_{k-1})$.

By (2.A.11), (v_1, \dots, v_k) is linely inde in V. If span $(v_1, \dots, v_k) = V$, then we stop.

Because V is finite-dim, this process will stop after n steps.

Or. Suppose $U \neq \{0\}$. Let $B_U = (u_1, \dots, u_m)$. Extend to a basis (u_1, \dots, u_n) of V.

Then let $B_V = (u_1 - u_k, \dots, u_m - u_k, u_{m+1}, \dots, u_k, \dots, u_n).$

1 Find all vecsps on whatever F that have exactly one basis.

SOLUTION: The trivial vecsp $\{0\}$ will do. Indeed, the only basis of $\{0\}$ is the empty list ().

Otherwise, we have $L = a_{k+1}p_{k+1}(x) + \cdots + a_mp_m(x)$.

- Note For [2.11]: Good definition for a general term always aviods undefined behaviours. If deg p=0, then $p(z)=a_0\neq 0$, but not literally a_0z^0 , by which if p is defined, then it comes to 0^0 . To make it clear, we specify that in $\mathcal{P}(\mathbf{F})$, $a_0z^0=a_0$, where z^0 appears just for notational convenience. Because by definition, the term a_0z^0 in a poly only represents the const term of the poly, which is a_0 . For convenience, we assume that $z^0=1$ in formula deduction and poly def. Absolutely without 0^0 .
- (4E 10) Suppose m is a positive integer. For $0 \le k \le m$, let $p_k(x) = x^k (1-x)^{m-k}$. Show that (p_0, \ldots, p_m) is a basis of $\mathcal{P}_m(\mathbf{F})$.

SOLUTION: We may see $p_0 = 1$ and $p_m(x) = x^m$, from the expansion below, by the Note For [2.11] above.

Note that each
$$p_k(x) = \sum_{j=0}^{m-k} C_{m-k}^j (-1)^j \cdot x^{j+k} \cdot 1^j = \underbrace{(-1)^0 \cdot x^k \cdot 1^0}_{\text{of deg k}} + \underbrace{\sum_{j=1}^{m-k} C_{m-k}^j (-1)^j \cdot x^{j+k} \cdot 1^j}_{\text{of deg m; denote it by } q_k(x)}$$

OR. Similar to the TIPS above. We will recursively prove that each $x^{m-k} \in \text{span}(p_m, ..., p_{m-k})$.

- (i) k = 1. $p_m(x) = x^m \in \text{span}(p_m)$; $p_{m-1}(x) = x^{m-1} x^m \Rightarrow x^{m-1} \in \text{span}(p_{m-1}, p_m)$.
- (ii) $k \in \{1, \dots, m-1\}$. Suppose for each $k \in \{0, \dots, k\}$, we have $x^{m-k} \in \text{span}(p_{m-k}, \dots, p_m)$, $\exists ! a_m \in \mathbb{F}$. Note that $x^{m-(k+1)} = p_{m-(k+1)}(x) + \sum_{j=1}^{k+1} C_{k+1}^j (-1)^{j+1} x^{m-(k+1)+j} \in \text{span}(p_{m-(k+1)}, x^{m-k}, \dots, x^m)$. Thus $x^{m-(k+1)} \in \text{span}(p_{m-(k+1)}, p_{m-k}, \dots, p_m)$.

COMMENT: The base step and the inductive step can be independent.

OR. For any $m,k \in \mathbb{N}^+$ such that $k \leq m$. Define $p_{k,m}$ by $p_{k,m}(x) = x^k (1-x)^{m-k}$. Define the statement S(m) by $S(m):(p_{0,m},\ldots,p_{m,m})$ is linely inde (and therefore is a basis). We use induction on to show that S(m) holds for all $m \in \mathbb{N}^+$.

- (i) m = 0. $p_{0,0} = 1$, and $ap_{0,0} = 0 \Rightarrow a = 0$. m = 1. Let $a_0(1-x) + a_1x = 0$, $\forall x \in \mathbf{F}$. Then take x = 1, $x = 0 \Rightarrow a_1 = a_0 = 0$.
- (ii) $1 \le m$. Assume that S(m) and S(m-1) holds. Now we show that S(m+1) holds. Suppose $\sum_{k=0}^{m+1} a_k p_{k,m+1}(x) = \sum_{k=0}^{m+1} a_k \left[x^k (1-x)^{m+1-k} \right] = 0, \forall x \in \mathbb{F}$.

Now
$$a_0(1-x)^{m+1} + \sum_{k=1}^m a_k x^k (1-x)^{m+1-k} + a_{m+1} x^{m+1} = 0, \forall x \in \mathbf{F}.$$

While
$$x = 0 \Rightarrow a_0 = 0$$
; and $x = 1 \Rightarrow a_{m+1} = 0$.

Then
$$0 = \sum_{k=1}^{m} a_k x^k (1-x)^{m+1-k}$$

 $= x(1-x) \sum_{k=1}^{m} a_k x^{k-1} (1-x)^{m-k}$, note that $m-k = (m-1) - (k-1)$
 $= x(1-x) \sum_{k=0}^{m-1} a_{k+1} x^k (1-x)^{m-1-k} = x(1-x) \sum_{k=0}^{m-1} a_{k+1} p_{k,m-1}(x)$.

Hence $\sum_{k=0}^{m-1} a_{k+1} p_{k,m-1}(x) = 0, \forall x \in \mathbb{F} \setminus \{0,1\}$. Which has infinitely many zeros.

Moreover, $\sum_{k=0}^{m-1} a_{k+1} p_{k,m-1}(x) = 0$. By assumption, $a_1 = \dots = a_{m-1} = a_m = 0$.

Thus $(p_{0,m+1},...,p_{m+1,m+1})$ is linely inde and S(m+1) holds.

17 Suppose V_1 , V_2 , V_3 are subsps of a finite-dim vecsp, then

$$\dim(V_1 + V_2 + V_3) = \dim V_1 + \dim V_2 + \dim V_3$$

$$-\dim(V_1 \cap V_2) - \dim(V_1 \cap V_3) - \dim(V_2 \cap V_3) + \dim(V_1 \cap V_2 \cap V_3).$$

Explain why you might think and prove the formula above or give a counterexample.

SOLUTION:

[*Similar to*] Given three sets *A*, *B* and *C*.

Because
$$|X \cup Y| = |X| + |Y| - |X \cap Y|$$
; $(X \cup Y) \cap Z = (X \cap Z) \cup (Y \cap Z)$.

Now
$$|(A \cup B) \cup C| = |A \cup B| + |C| - |(A \cup B) \cap C|$$
.

And
$$|(A \cup B) \cap C| = |(A \cap C) \cup (B \cap C)| = |A \cap C| + |B \cap C| - |A \cap B \cap C|.$$

Hence
$$|(A \cup B) \cup C| = |A| + |B| + |C| + |A \cap B \cap C| - |A \cap B| - |A \cap C| - |B \cap C|$$
.

Note that $(V_1 + V_2) + V_3 = V_1 + (V_2 + V_3) = (V_1 + V_3) + V_2$.

$$\dim(V_1 + V_2 + V_3) = \dim(V_1 + V_2) + \dim(V_3) - \dim((V_1 + V_2) \cap V_3)$$
(1)
=
$$\dim(V_2 + V_3) + \dim(V_1) - \dim((V_2 + V_3) \cap V_1)$$
(2)

$$= \dim(V_1 + V_3) + \dim(V_2) - \dim((V_1 + V_3) \cap V_2)$$
 (3).

Notice that in general, $(X + Y) \cap Z \neq (X \cap Z) + (Y \cap Z)$.

For example,
$$X = \{(x,0) \in \mathbb{R}^2 : x \in \mathbb{R}\}, Y = \{(0,y) \in \mathbb{R}^2 : y \in \mathbb{R}\}, Z = \{(z,z) \in \mathbb{R}^2 : z \in \mathbb{R}\}.$$

COMMENT: If $X \subseteq Y$, then $(X + Y) \cap Z = Y \cap Z$; $\dim(X + Y + Z) = \dim(Y) + \dim(Z) - \dim(Y \cap Z)$, and the wrong formual holds. Similar for $Y \subseteq Z$, $X \subseteq Z$, and $X, Y \subseteq Z$.

However, $(X + Y) \cap Z \supseteq (X \cap Z) + (Y \cap Z)$ holds. Because $\forall v \in (X \cap Z) + (Y \cap Z)$,

$$\exists \, u = x_1 = z_1 \in X \cap Z, w = y_2 = z_2 \in Y \cap Z, \, v = u + w = x_1 + y_2 = z_1 + z_2 \in (X + Y) \cap Z.$$

Comment: $\dim((X + Y) \cap Z) \ge \dim(X \cap Z) + \dim(Y \cap Z) - \dim(X \cap Y \cap Z)$.

• Corollary: Suppose V_1 , V_2 , V_3 are finite-dim, then $\frac{(1)+(2)+(3)}{3}$:

11 Suppose U is a subsp of V and S \in \mathcal{L}(U, W).
     Prove that \exists T \in \mathcal{L}(V, W), Tu = Su, \forall u \in U. (Or. \exists T \in \mathcal{L}(V, W), T|_{U} = S.)
     In other words, every linear map on a subsp of V can be extended to a linear map on the entire V.
SOLUTION: Suppose W is such that V = U \oplus W. Then \forall v \in V, \exists ! u_v \in U, w_v \in W, v = u_v + w_v.
                Define T \in \mathcal{L}(V, W) by T(u_v + w_v) = Su_v.
                Or. [Finite-dim Req] Define by T\left(\sum_{i=1}^{m} a_i u_i\right) = \sum_{i=1}^{n} a_i S u_i. Let B_V = \left(\overline{u_1, \dots, u_n}, \dots, u_m\right). \square
12 Suppose nonzero V is finite-dim and W is infinite-dim. Prove that \mathcal{L}(V, W) is infinite-dim.
SOLUTION: Using (2.A.14).
   Let B_V = (v_1, \dots, v_n) be a basis of V. Let (w_1, \dots, w_m) be linely inde in W for any m \in \mathbb{N}^+.
   Define T_{x,y}: V \to W by T_{x,y}(v_z) = \delta_{z,x} w_y, \forall x \in \{1, ..., n\}, y \in \{1, ..., m\}, where \delta_{z,x} = \begin{cases} 0, & z \neq x, \\ 1, & z = x. \end{cases}
   \forall v = \sum_{i=1}^{n} a_i v_i, \ u = \sum_{i=1}^{n} b_i v_i, \ \lambda \in \mathbf{F}, T_{x,y}(v + \lambda u) = (a_x + \lambda b_x) w_y = T_{x,y}(v) + \lambda T_{x,y}(u).
   Linearity checked. Now suppose a_1T_{x,1} + \cdots + a_mT_{x,m} = 0.
   Then (a_1T_{x,1} + \dots + a_mT_{x,m})(v_x) = 0 = a_1w_1 + \dots + a_mw_m \Rightarrow a_1 = \dots = a_m = 0. \mathbb{Z} m arbitrary.
   Thus (T_{x,1}, ..., T_{x,m}) is a linely inde list in \mathcal{L}(V, W) for any x and length m. Hence by (2.A.14).
13 Suppose (v_1, ..., v_m) is linely depe in V and W \neq \{0\}.
     Prove that \exists w_1, \dots, w_m \in W, \nexists T \in \mathcal{L}(V, W) such that Tv_k = w_k, \forall k = 1, \dots, m.
SOLUTION:
   We prove by contradiction. By linear dependence lemma, \exists j \in \{1, ..., m\}, v_i \in \text{span}(v_1, ..., v_{i-1}).
   Suppose a_1v_1 + \cdots + a_mv_m = 0, where a_i \neq 0. Now let w_i \neq 0, while w_1 = \cdots = w_{i-1} = w_{i+1} = w_m = 0.
   Define T \in \mathcal{L}(V, W) by Tv_k = w_k for each k. Then T(a_1v_1 + \cdots + a_mv_m) = 0 = a_1w_1 + \cdots + a_mw_m.
   And 0 = a_i w_i, while a_i \neq 0 and w_i \neq 0. Contradicts.
                                                                                                                                              OR. We prove the contrapositive: Suppose \forall w_1, \dots, w_m \in W, \exists T \in \mathcal{L}(V, W), Tv_k = w_k for each w_k.
   Now we show that (v_1, ..., v_n) is linely inde. Suppose \exists a_i \in F, a_1v_1 + \cdots + a_nv_n = 0.
   Choose one w \in W \setminus \{0\}. By assumption, for (\overline{a_1}w, \dots, \overline{a_m}w), \exists T \in \mathcal{L}(V, W), Tv_k = \overline{a_k}w for each v_k.
   Now we have 0 = T(\sum_{k=1}^{m} a_k v_k) = \sum_{k=1}^{m} a_k T v_k = \sum_{k=1}^{m} a_k \overline{a_k} w = (\sum_{k=1}^{m} |a_k|^2) w.
   Then \sum_{k=1}^{m} |a_k|^2 = 0. Thus a_1 = \cdots = a_m = 0. Hence (v_1, \ldots, v_n) is linely inde.
                                                                                                                                              • (4E 17) Suppose V is finite-dim. Show that all two-sided ideals of \mathcal{L}(V) are \{0\} and \mathcal{L}(V).
  A subsp \mathcal{E} of \mathcal{L}(V) is called a two-sided ideal of \mathcal{L}(V) if TE \in \mathcal{E}, ET \in \mathcal{E}, \forall E \in \mathcal{E}, T \in \mathcal{L}(V).
SOLUTION: Let B_V = (v_1, ..., v_n). If \mathcal{E} = 0, then we are done.
   Suppose \mathcal{E} \neq 0 and \mathcal{E} is a two-sided ideal of \mathcal{L}(V). Let S \in \mathcal{E} \setminus \{0\}.
   Suppose Sv_i \neq 0 and Sv_i = a_1v_1 + \cdots + a_nv_n, where a_k \neq 0.
   Define R_{x,y} \in \mathcal{L}(V) by R_{x,y}: v_x \mapsto v_y, v_z \mapsto 0 (z \neq x). Or. R_{x,y}v_z = \delta_{z,x}v_y.
   Then (R_{1.1} + \cdots + R_{n.n})v_i = v_i \Rightarrow \sum_{r=1}^n R_{r,r} = I. Assume that each R_{x,y} \in \mathcal{E}.
   Hence \forall T \in \mathcal{L}(V), I \circ T = T \circ I = T \in \mathcal{E} \Rightarrow \mathcal{E} = \mathcal{L}(V). Now we prove the assumption.
   Notice that \forall x, y \in \mathbb{N}^+, (R_{k,y}S)(v_i) = a_k v_y \Rightarrow ((R_{k,y}S) \circ R_{x,i})(v_z) = \delta_{z,x}(a_k v_y).
   Thus R_{k,y}SR_{x,i} = a_kR_{x,y}. Now S \in \mathcal{E} \Rightarrow R_{k,y}S \in \mathcal{E} \Rightarrow R_{x,y} \in \mathcal{E}.

SOLUTION: Note that dim range TS \leq \min \{ \dim \text{range } T, \dim \text{range } S \}. We prove by contradiction.
   Assume that dim range TS \geqslant \left| \frac{n}{2} \right| + 1. Then \min \left\{ n - \dim \operatorname{null} T, n - \dim \operatorname{null} S \right\} \geqslant \left| \frac{n}{2} \right| + 1
    \mathbb{Z} dim null ST = n \leq \dim \operatorname{null} S + \dim \operatorname{null} T \mid \Rightarrow \max \left\{ \dim \operatorname{null} T, \dim \operatorname{null} S \right\} \leq \left\lceil \frac{n}{2} \right\rceil - 1.
   Thus n \le 2(\left\lceil \frac{n}{2} \right\rceil - 1) \Rightarrow \frac{n}{2} \le \left\lceil \frac{n}{2} \right\rceil - 1. Contradicts.
                                                                                                                                                                            OR. dim null S = n - \dim \operatorname{range} S \leq n - \dim \operatorname{range} TS. X ST = 0 \Rightarrow \operatorname{range} T \subseteq \operatorname{null} S.
   \dim \operatorname{range} TS \leqslant \dim \operatorname{range} T \leqslant \dim \operatorname{null} S \leqslant n - \dim \operatorname{range} TS. Thus 2\dim \operatorname{range} TS \leqslant n.
                                                                                                                                                                            OR. Because dim range TS \leq \left\lfloor \frac{n}{2} \right\rfloor, and \left\lfloor \frac{n}{2} \right\rfloor + \left\lfloor \frac{n}{2} \right\rfloor = n.
   We show that dim null TS \geqslant \left\lceil \frac{n}{2} \right\rceil. Note that dim null S + \dim \text{null } T \geqslant n.
   \dim \operatorname{null} S + \dim \operatorname{null} T|_{\operatorname{range} S} = \dim \operatorname{null} TS. If \dim \operatorname{null} S \geqslant \left\lceil \frac{n}{2} \right\rceil. Then we are done.
   Otherwise, dim null S \le \left\lceil \frac{n}{2} \right\rceil - 1 \Rightarrow \dim \text{null } T \ge n - \dim \text{null } S \ge n - \left\lceil \frac{n}{2} \right\rceil + 1 = \left\lceil \frac{n}{2} \right\rceil + 1 \ge \left\lceil \frac{n}{2} \right\rceil.
   Thus dim null TS \ge \max \{ \dim \text{null } S, \dim \text{null } T \} = \left\lceil \frac{n}{2} \right\rceil.

• Column-Row Factorization (CR Factorization) Suppose $A \in \mathbf{F}^{m,n}$, $A \neq 0$. *Prove, with p specified below, that* $\exists C \in \mathbb{F}^{m,p}$, $R \in \mathbb{F}^{p,n}$, A = CR.

(a) Suppose $S_c = \operatorname{span}(A_{\cdot,1}, \dots, A_{\cdot,n}) \subseteq \mathbf{F}^{m,1}$, dim $S_c = c$, the col rank. Let p = c.

(b) Suppose $S_r = \operatorname{span}(A_{1,r}, \dots, A_{m,r}) \subseteq \mathbf{F}^{1,n}$, dim $S_r = r$, the row rank. Let p = r.

SOLUTION: Using [4E 3.51]. Notice that $A \neq 0 \Rightarrow c, r \geqslant 1$.

(a) Reduce to basis $B_C = (C_{\cdot,1}, \dots, C_{\cdot,c})$, forming $C \in \mathbb{F}^{m,c}$. Then $\forall k \in \{1, \dots, n\}$, $A_{\cdot,k} = R_{1,k}C_{\cdot,1} + \cdots + R_{c,k}C_{\cdot,c} = (CR)_{\cdot,k}$, $\exists ! R_{1,k}, \cdots, R_{c,k} \in \mathbf{F}$, forming $R \in \mathbf{F}^{c,n}$. Thus A = CR.

(b) Reduce to basis $B_R = (R_{1,r}, \dots, R_{r,r})$, forming $R \in \mathbf{F}^{r,n}$. Then $\forall j \in \{1, \dots, m\}$, $A_{i,\cdot} = C_{i,1}R_{1,\cdot} + \dots + C_{i,r}R_{r,\cdot} = (CR)_{i,\cdot}, \exists ! C_{i,1}, \dots, C_{i,r} \in \mathbf{F}, \text{ forming } C \in \mathbf{F}^{m,r}. \text{ Thus } A = CR.$

EXAMPLE: $A = \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \\ 46 & 33 & 20 & 7 \end{pmatrix} \xrightarrow{\text{(I)}} \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \end{pmatrix} \xrightarrow{\text{(II)}} \begin{pmatrix} 7 & 4 \\ 19 & 12 \\ 33 & 20 \end{pmatrix} \begin{pmatrix} 2 & -1 \\ 1 & 0 \\ 0 & 1 \\ 1 & 2 \end{pmatrix}$

(I) $\begin{pmatrix} 46 & 33 & 20 & 7 \end{pmatrix} = 2\begin{pmatrix} 10 & 7 & 4 & 1 \end{pmatrix} + \begin{pmatrix} 26 & 19 & 12 & 5 \end{pmatrix} = \begin{pmatrix} 2 & 1 \end{pmatrix} \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \end{pmatrix}$, using [4E 3.51(b)]. $(46\ 33\ 20\ 7) \in \text{span}(A_{1,\cdot}, A_{2,\cdot}), \text{ and } (A_{1,\cdot}, A_{2,\cdot}) \text{ is linely inde. Thus } B_R = (A_{1,\cdot}, A_{2,\cdot}).$

(II)
$$\begin{pmatrix} 10\\26\\46 \end{pmatrix} = 2 \begin{pmatrix} 7\\19\\33 \end{pmatrix} - \begin{pmatrix} 4\\12\\20 \end{pmatrix}; \quad \begin{pmatrix} 1\\5\\7 \end{pmatrix} = -\begin{pmatrix} 7\\19\\33 \end{pmatrix} + 2 \begin{pmatrix} 4\\12\\20 \end{pmatrix}. \text{ Thus } B_C = (A_{\cdot,2}, A_{\cdot,3}).$$

Using $[3.B \text{ TIPS } (4)]$. Let $U \oplus \text{null } T = V$; $B_U = (v_1, \dots, v_n)$, $B_V = (v_1, \dots, v_m)$. For each $k \in \{1, \dots, n\}$, $Tv_k \neq 0 \iff A_{\cdot,k} \neq 0$. Hence every such $A_{\cdot,k}$ has at least one nonzero entry. \square
OR. We prove by contradiction. Suppose A has at most $(n-1)$ nonzero entries. Then by Pigeon Hole Principle, at least one of $A_{\cdot,1},\ldots,A_{\cdot,n}$ equals 0.
Thus there are at most $(n-1)$ nonzero vecs in $Tv_1,, Tv_n$. $\forall \text{ range } T = \text{span}(Tv_1,, Tv_n) \Rightarrow \text{dim range } T = \text{dim span}(Tv_1,, Tv_n) \leq n-1$. Contradicts. \Box

SOLUTION:
(a) Suppose $B_V = (v_1, \dots, v_n)$, $B_W = (w_1, \dots, w_m)$ are the bases such that all entries of A equal 1. Then $Tv_i = w_1 + \dots + w_m$ for all $i = 1, \dots, n$. Because w_1, \dots, w_n is linely inde, $w_1 + \dots + w_n \neq 0$.

OR. Suppose $B_{\text{range }T} = (w)$. By $[2.\text{C Note For } (15)]$, $\exists B_W = (w_1, \dots, w_m)$, $w = w_1 + \dots + w_m$. Now suppose $u_1, u_2 \in U$, then each $u_i = w_i + \xi(x_i), \exists ! w_i \in W, x_i \in X$. Linearity: $\forall \lambda \in \mathbf{F}, \pi(u_1 + \lambda u_2) = w_1 + \lambda w_2 = \pi(u_1) + \lambda \pi(u_2)$. Injectivity: $\pi(u_1) = \pi(u_2) \Rightarrow w_1 = w_2 \Rightarrow \xi(x_1) = \xi(x_2) \Rightarrow x_1 = x_2 \Rightarrow u_1 = u_2$. Surjectivity: $\forall w \in W, \pi(w) = w \in \text{range } \pi$. Thus π is an iso of U onto W.

Let $B_V = (v_1, ..., v_n)$. If $\mathcal{E} = 0$, then we are done. Suppose $\mathcal{E} \neq 0$ and \mathcal{E} is a two-sided ideal of $\mathcal{L}(V)$.

   Fix one k. Now we have T(\frac{1}{2}v_k) = A_{1,k}v_1 + \dots + A_{k,k}(\frac{1}{2}v_k) + \dots + A_{m,k}v_m

   Then A_{j,k}=2A_{j,k}\Rightarrow A_{j,k}=0 for all j\neq k. Thus Tv_k=A_{k,k}v_k, \forall k\in\{1,\ldots,m\}.
   Now we show that A_{k,k} = A_{j,j} for all j \neq k. Choose j,k such that j \neq k.

1 A function $T: V \to W$ is linear \iff The graph of T is a subspace of $V \times W$.

2 Suppose $V_1 \times \cdots \times V_m$ is finite-dim. Prove that each V_i is finite-dim.

SOLUTION:

For any $k \in \{1, ..., m\}$, define $S_k \in \mathcal{L}(V_1 \times \cdots \times V_m, V_k)$ by $S_k(v_1, ..., v_m) = v_k$.

Then S_k is linear map. By [3.22], range $S_k = V_k$ is finite-dim.

Or. Denote $V_1 \times \cdots \times V_m$ by U. Denote $\{0\} \times \cdots \{0\} \times V_i \times \{0\} \cdots \times \{0\}$ by U_i .

We show that each U_i is iso to V_i . Then U is finite-dim \Longrightarrow its subsp U_i is finite-dim, so is V_i .

$$\operatorname{Let} B_U = (v_1, \dots, v_M) \mid \operatorname{Define} R_i \in \mathcal{L}(V_i, U_i) \text{ by } R_i(u_i) = (0, \dots, 0, u_i, 0, \dots, 0) \\ \operatorname{Define} S_i \in \mathcal{L}(U, V_i) \text{ by } S_i(u_1, \dots, u_i, \dots, u_m) = u_i \end{cases} \Rightarrow \begin{cases} R_i S_j|_{U_j} = \delta_{i,j} I_{U_j}, \\ S_i R_j = \delta_{i,j} I_{V_i}. \end{cases} \square$$

4 Prove that $\mathcal{L}(V_1 \times \cdots \times V_m, W)$ and $\mathcal{L}(V_1, W) \times \cdots \times \mathcal{L}(V_m, W)$ are iso.

SOLUTION: Using notation in Problem (2): $R_i : u_i \mapsto (0, ..., u_i, ..., 0)$; $S_i : (u_1, ..., u_m) \mapsto u_i$.

Note that $T(u_1, ..., u_m) = T(u_1, 0, ..., 0) + ... + T(0, ..., u_m)$.

Define $\varphi: T \mapsto (T_1, \dots, T_m)$ by $\varphi(T) = (TR_1, \dots, TR_m)$. Define $\psi: (T_1, \dots, T_m) \mapsto T$ by $\psi(T_1, \dots, T_m) = T_1S_1 + \dots + T_mS_m$. $\} \Rightarrow \psi = \varphi^{-1}$.

5 Prove that $\mathcal{L}(V, W_1 \times \cdots \times W_m)$ and $\mathcal{L}(V, W_1) \times \cdots \times \mathcal{L}(V, W_m)$ are iso.

SOLUTION: Using notation in Problem (2): $R_i : u_i \mapsto (0, ..., u_i, ..., 0)$; $S_i : (u_1, ..., u_m) \mapsto u_i$.

Note that $T_i: v \mapsto w_i$, Define $\varphi: T \mapsto (T_1, \dots, T_m)$ by $\varphi(T) = (S_1 T, \dots, S_m T)$. $T: v \mapsto (w_1, \dots, w_m)$. Define $\psi: (T_1, \dots, T_m) \mapsto T$ by $\psi(T_1, \dots, T_m) = R_1 T_1 + \dots + R_m T_m$.

6 For $m \in \mathbb{N}^+$, define V^m by $\underbrace{V \times \cdots \times V}_{m \text{ times}}$. Prove that V^m and $\mathcal{L}(\mathbf{F}^m, V)$ are iso.

SOLUTION:

Define $T:(v_1,\ldots,v_m)\to \varphi$, where $\varphi:(a_1,\ldots,a_m)\mapsto v$ is defined by $\varphi(a_1,\ldots,a_m)=a_1v_1+\cdots+a_mv_m$.

- (a) Suppose $T(v_1, ..., v_m) = 0$. Then $\forall (a_1, ..., a_n) \in \mathbb{F}^m$, $\varphi(a_1, ..., a_m) = a_1 v_1 + ... + a_m v_m = 0$ For each k, let $a_k = 1$, $a_j = 0$ for all $j \neq k$. Then each $v_k = 0 \Rightarrow (v_1, \dots, v_m) = 0$. Thus T is inje.
- (b) Suppose $\psi \in \mathcal{L}(\mathbf{F}^m, V)$. Let (e_1, \dots, e_m) be the std basis of \mathbf{F}^m . Then $\forall (b_1, \dots, b_n) \in \mathbf{F}^m$, $\left[T \left(\psi(e_1), \dots, \psi(e_m) \right) \right] (b_1, \dots, b_m) = b_1 \psi(e_1) + \dots + b_m \psi(e_m) = \psi(b_1 e_1 + \dots + b_m e_m) = \psi(b_1, \dots, b_m).$ Thus $T(\psi(e_1), \dots, \psi(e_m)) = \psi$. Hence T is surj.

3 Give an example of a vecsp V and its two subsps U_1 , U_2 such that $U_1 \times U_2$ and $U_1 + U_2$ are iso but $U_1 + U_2$ is not a direct sum. [V must be infinite-dim.]

SOLUTION: NOTE that at least one of U_1 , U_2 must be infinite-dim. And at least one must be finite-dim??

Let $V = \mathbb{F}^{\infty} = U_1$, $U_2 = \{(x, 0, \dots) \in \mathbb{F}^{\infty} : x \in \mathbb{F}\}$. Then $V = U_1 + U_2$ is not a direct sum.

 $\begin{array}{l} \text{Define } T \in \mathcal{L}\big(U_1 \times U_2, U_1 + U_2\big) \text{ by } T\big(\big(x_1, x_2, \cdots\big), \big(x, 0, \cdots\big)\big) = \big(x, x_1, x_2, \cdots\big) \\ \text{Define } S \in \mathcal{L}\big(U_1 + U_2, U_1 \times U_2\big) \text{ by } S\big(x, x_1, x_2, \cdots\big) = \big(\big(x_1, x_2, \cdots\big), \big(x, 0, \cdots\big)\big) \end{array} \right\} \Rightarrow S = T^{-1}.$

- Note For [3.79, 3.83]: If $U = \{0\}$, then $v + U = v + \{0\} = \{v\}$, $V/U = V/\{0\} = \{\{v\} : v \in V\}$. If U = V, then v + V = 0 + V, $V/V = \{v + V : v \in V\} = \{0\}$. If $U = \emptyset$, then $v + U = v + \emptyset = \emptyset$, $V/U = V/\emptyset = \{\emptyset\}$.
- Comment: If U is merely a subset of V, then [3.85, 3.86] do not hold, and V/U is not a vecsp. Because $((v-w)+u)\in U$ or $u-u'\in U$ needs that U is closed under add. And because $(v-\hat{v})+(w-\hat{w})\in U$ and $\lambda(v-\hat{v})\in U$ assume that U is a subsp. If U is a vecsp but not a subsp of V, then everything will be all right. If U is a vecsp and $U\cap V=\{0\}$, then $v+U=w+U\Rightarrow v=w$.
- Note For [3.85]: $v + U = w + U \iff v \in w + U, \ w \in v + U \iff v w \in U \iff (v + U) \cap (w + U) \neq \emptyset.$
- (4E 8) Suppose $T \in \mathcal{L}(V,W)$, $w \in \text{range } T$. Prove that $\{v \in V : Tv = w\} = u + \text{null } T$. Solution: Let $\mathcal{K}_u = \{v \in V : Tv = w\}$. [Not a vecsp.] Suppose $u \in \mathcal{K}_u$. Then $u + \text{null } T \subseteq \mathcal{K}_u$. And $\forall u' \in \mathcal{K}_u$, $u' - u \in \text{null } T \Rightarrow u' \in u + \text{null } T$. Now $\mathcal{K}_u \subseteq u + \text{null } T$.

7 Suppose $v, x \in V$, and U, W are subsps of V. Prove that $v + U = x + W \Rightarrow U = W$.

 $\textbf{SOLUTION:} \ \ (\mathbf{a}) \ v \in v + U = x + W \Rightarrow \exists \ w_v \in W, v = x + w_v \Rightarrow v - x \in W.$

(b) $x \in x + W = v + U \Rightarrow \exists u_x \in U, x = v + u_x \Rightarrow x - v \in U.$

Now x + U = v + U = x + W = v + W. Thus $\{v + u : u \in U\} = \{v + w : w \in W\} \Rightarrow U = W$.

Or.
$$\pm (v - x) \in U \cap W \Rightarrow \begin{cases} u_1 = (x - v) + w_1 \in W \Rightarrow U \subseteq W \\ w_2 = (v - x) + u_2 \in U \Rightarrow W \subseteq U \end{cases} \Rightarrow U = W.$$

8 Suppose A is a nonempty subset of V.

Prove that A is a translate of some subsp of $V \Longleftrightarrow \lambda v + (1 - \lambda)w \in A$, $\forall v, w \in A, \lambda \in F$. Solution:

- (a) Suppose A = a + U. Then $\lambda(a + u_1) + (1 \lambda)(a + u_2) = a + (\lambda(u_1 u_2) + u_2) \in A$.
- (b) Suppose $\lambda v + (1 \lambda)w \in A$, $\forall v, w \in A, \lambda \in \mathbf{F}$. Suppose $\underline{a \in A}$ and let $A' = \{x a : x \in A\}$. Then $0 \in A'$ and $\forall (v a), (w a) \in A', \lambda \in \mathbf{F}$,
 - (I) $\lambda(v-a) = [\lambda v + (1-\lambda)a] a \in A'$.
 - (II) Because $\lambda(v-a) + (1-\lambda)(w-a) = [\lambda v + (1-\lambda)w] a \in A'$. Let $\lambda = \frac{1}{2}$ here and use (I) above by $\lambda = 2$, we have $(v-a) + (w-a) \in A'$.

Or. Note that $v, a \in A \Rightarrow \lambda v + (1 - \lambda)a = 2v - a \in A$. Similarly $2w - a \in A$.

Now $(v - \frac{1}{2}a) + (w - \frac{1}{2}a) = v + w - a \in A \Rightarrow v + w - 2a = (v - a) + (w - a) \in A'$.

Thus A' = -a + A is a subsp of V. Hence $a + A' = a + \{x - a : x \in A\} = A$ is a translate.

• Note For [3.88, 3.90, 3.91]: Suppose W \in \mathcal{S}_V U. Then V/U is iso to W.
  Because \forall v \in V, \exists ! u_v \in U, w_v \in W, v = u_v + w_v. Define T \in \mathcal{L}(V) by T(v) = w_v.
  Hence null T = U, range T = W, range T \oplus \text{null } T = V.
  Then \tilde{T} \in \mathcal{L}(V/\text{null }T,V) is defined by \tilde{T}(v+U) = \tilde{T}(w'_v+U) = Tw'_v = w_v. [See TIPS (1) below]
  Now \pi \circ \tilde{T} = I_{V/U}, \tilde{T} \circ \pi|_W = I_W = T|_W. Hence \tilde{T} is an iso of V/U onto W.
• TIPS 1: Suppose U is a subsp of V. Define S \in \mathcal{L}(V/U, V) by S(v + U) = v.
  Then range S is the purest in S_V U. Now null S = \{0\}, U \oplus \text{range } S = V.
  Let E = S \circ \pi. Because S is inje and \pi is surj, null E = \text{null } \pi = U, range E = \text{range } S.
  Then range E \oplus \text{null } E = V. NOTICE that E: V \to W is the purest eraser. Now we explain why:
  EXAMPLE: Let V = \mathbb{F}^2, B_{11} = (e_1), B_{W} = (e_2 - e_1) \Rightarrow U \oplus W = V.
                 Notice that T(e_2 - e_1) = (e_2 - e_1), while (e_2 - e_1) + U = e_2 + U, but
                 because e_2 = e_1 + (e_2 - e_1), now still, \tilde{T}((e_2 - e_1) + U) = e_2 - e_1 = Te_2.
                 In contrast, S((e_2 - e_1) + U) = S(e_2 + U) = e_2, E(e_2 - e_1) = e_2.
                 And range E = \text{range } S = \text{span}(e_2) is the purest in S_V U.
12 Suppose U is a subsp of V. Prove that is V is iso to U \times (V/U).

18 Suppose $T \in \mathcal{L}(V, W)$ and U is a subsp of V. Let $\pi : V \to V/U$ be the quotient map. Prove that $\exists S \in \mathcal{L}(V/U, W), T = S \circ \pi \iff U \subseteq \text{null } T$.

SOLUTION:

- (a) Suppose $\exists S \in \mathcal{L}(V/U, W), T = S \circ \pi$. Then $U = \text{null } \pi \subseteq \text{null } (S \circ \pi) = \text{null } T$.
- (b) Suppose $U = \operatorname{null} \pi \subseteq \operatorname{null} T$. By (3.B.24), we are done. Or. Define $S : (v + U) \mapsto Tv$. $v_1 + U = v_2 + U \iff v_1 v_2 \in \operatorname{null} T \iff Tv_1 = Tv_2$. Thus S is well-defined. Hence $S \circ \pi = T$. \square

COROLLARY: Define $\Gamma: S \mapsto S \circ \pi$. Then Γ is inje, range $\Gamma = \{T \in \mathcal{L}(V, W) : U \subseteq \text{null } T\}$.

- **14** Suppose $U = \{(x_1, x_2, \dots) \in \mathbb{F}^{\infty} : x_k \neq 0 \text{ for only finitely many } k\}.$
 - (a) Show that U is a subsp of \mathbf{F}^{∞} . [Do it in your mind]
 - (b) Prove that \mathbf{F}^{∞}/U is infinite-dim.

SOLUTION: For ease of notation, denote the p^{th} term of $u = (x_1, \dots, x_p, \dots) \in \mathbf{F}^{\infty}$ by u[p].

$$\text{For each } r \in \mathbf{N}^+, \text{ let } e_r\big[k\big] = \left\{ \begin{array}{l} 1, \ (k-1) \equiv 0 \ \big(\text{mod} \ r \big) \\ 0, \ \text{otherwise} \end{array} \right| \ \text{simply } e_r = \big(1, \underbrace{0, \cdots, 0}_{(r-1)}, 1, \underbrace{0, \cdots, 0}_{(r-1)}, 1, \cdots \big).$$

For $m \in \mathbb{N}^+$. Let $a_1(e_1 + U) + \dots + a_m(e_m + U) = 0 + U \Rightarrow \exists u \in U, a_1e_1 + \dots + a_me_m = u$.

Suppose $u = (x_1, \dots, x_L, 0, \dots)$, where L is the largest such that $u[L] \neq 0$.

Let $s \in \mathbb{N}^+$ be such that $h = s \cdot m! + 1 > L$, and $e_1[h] = \cdots = e_m[h] = 1$.

Notice that for any $p, r \in \{1, ..., m\}$, $e_r[s \cdot m! + 1 + p] = e_r[p + 1] = 1 \iff p \equiv 0 \pmod{r} \iff r \mid p$.

Let $1 = p_1 \leqslant \cdots \leqslant p_{\tau(p)} = p$ be the distinct factors of p. Moreover, $r \mid p \iff r = p_k$ for some k.

Now
$$u[h+p] = 0 = \left(\sum_{r=1}^{m} a_r e_r\right)[p+1] = \sum_{k=1}^{\tau(p)} a_{p_k}$$
.

Let
$$q = p_{\tau(p)-1}$$
. Then $\tau(q) = \tau(p) - 1$, and each $q_k = p_k$. Again, $\left(\sum_{r=1}^m a_r e_r\right) [h + q] = 0 = \sum_{k=1}^{\tau(p)-1} a_{p_k}$.

Thus $a_{p_{\tau(p)}} = a_p = 0$ for all $p \in \{1, \dots, m\} \Rightarrow (e_1, \dots, e_m)$ is linely inde in \mathbf{F}^{∞} .

So is
$$(e_1 + U, ..., e_m + U)$$
 in \mathbb{F}^{∞}/U . Because m is arbitrary. By (2.A.14).

Or. For each
$$r \in \mathbb{N}^+$$
, let $e_r[p] = \begin{cases} 1, & \text{if } 2^r \mid p \\ 0, & \text{otherwise} \end{cases}$

Similarly, let $m \in \mathbb{N}^+$ and $a_1(e_1 + U) + \cdots + a_m(e_m + U) = 0 \Rightarrow a_1e_1 + \cdots + a_me_m = u \in U$.

Suppose *L* is the largest such that $u[L] \neq 0$. And *l* is such that $2^{ml} > L$.

Then for each
$$k \in \{1, ..., m\}$$
, $u[2^{ml} + 2^k] = 0 = (\sum_{r=1}^m a_r e_r)[2^k] = a_1 + \cdots + a_k$.

Thus
$$a_1 = \cdots = a_m = 0$$
 and (e_1, \dots, e_m) is linely inde. Similarly.

(c) What is null T'? What is range T'?

$$T(x,y,z) = 0 \Longleftrightarrow \begin{cases} 4x + 5y + 6z = 0 \\ 7x + 8y + 9z = 0 \end{cases} \Longleftrightarrow \begin{cases} x + y + z = 0 \\ y = 2z = 0 \end{cases} \Longleftrightarrow (x,y,z) \in \operatorname{span}(e_1 - 2e_2 + e_3).$$

Where (e_1, e_2, e_3) is std basis of \mathbb{R}^3 .

Let $(e_1 - 2e_2 + e_3, -2e_2, e_3)$ be a basis, with the correspd dual basis $(\varepsilon_1, \varepsilon_2, \varepsilon_3)$.

Thus $\operatorname{span}(e_1 - 2e_2 + e_3) = \operatorname{null} T \Rightarrow \operatorname{span}(e_1 - 2e_2 + e_3)^0 = \operatorname{span}(\varepsilon_2, \varepsilon_3) = \operatorname{range} T'$.

Note that $\varepsilon_k = \varepsilon_k(e_1)\psi_1 + \varepsilon_k(e_2)\psi_2 + \varepsilon_k(e_3)\psi_3$.

And
$$\varepsilon_2(e_2) = -\frac{1}{2}$$

Hence $\varepsilon_2 = \psi_1 - \frac{1}{2}\psi_2$, $\varepsilon_3 = -\psi_1 + \psi_3$. Now range $T' = \text{span}(\psi_1 - \frac{1}{2}\psi_2, -\psi_1 + \psi_3)$.

$$\iota \in \mathcal{L}(V, U)$$
 by $\iota(v) = u_v$. So that $\Gamma(\varphi \circ i -) = (a_1, \dots, a_m)$.

OR. Let (e_1, \dots, e_m) be the std basis of \mathbf{F}^m and let (ψ_1, \dots, ψ_m) be the correspd dual basis.

Define $\Psi : \mathbf{F}^m \to (\mathbf{F}^m)'$ by $\Psi(e_k) = \psi_k$. Then Ψ is an iso.

Define $T \in \mathcal{L}(\mathbf{F}^m, V)$ by $Te_k = v_k$. Now $T(x_1, \dots, x_m) = T(x_1e_1 + \dots + x_me_m) = x_1v_1 + \dots + x_mv_m$.

 $\forall \varphi \in V', k \in \{1, \dots, m\}, [T'(\varphi)](e_k) = \varphi(Te_k) = \varphi(v_k) = [\varphi(v_1) \circ \psi_1 + \dots + \varphi(v_m) \circ \psi_m](e_k)$

Now $T'(\varphi) = \varphi(v_1) \circ \psi_1 + \dots + \varphi(v_m) \circ \psi_m = \Psi(\varphi(v_1), \dots, \varphi(v_m)) = \Psi(\Gamma(\varphi))$. Hence $T' = \Psi \circ \Gamma$.

By (3.B.3), (a) range $T = \operatorname{span}(v_1, \dots, v_m) = V \iff T' = \Psi \circ \Gamma$ inje $\iff \Gamma$ inje.

(b)
$$(v_1, ..., v_m)$$
 is linely inde $\iff T$ is inje $\iff T' = \Psi \circ \Gamma$ surj $\iff \Gamma$ surj.

• (4E 25) Define $\Gamma: V \to \mathbf{F}^m$ by $\Gamma(v) = (\varphi_1(v), \dots, \varphi_m(v))$, where $\varphi_1, \dots, \varphi_m \in V'$.

(c) Show that span $(\varphi_1, ..., \varphi_m) = V' \iff \Gamma$ is inje.

(d) Show that $(\varphi_1, ..., \varphi_m)$ is linely inde $\iff \Gamma$ is surj.

SOLUTION:

- (c) Notice that $\Gamma(v) = 0 \Longleftrightarrow \varphi_1(v) = \cdots = \varphi_m(v) = 0 \Longleftrightarrow v \in (\operatorname{null} \varphi_1) \cap \cdots \cap (\operatorname{null} \varphi_m)$. By Problem (4E 23) and (18), $\operatorname{span}(\varphi_1, \dots, \varphi_m) = V' \Longleftrightarrow (\operatorname{null} \varphi_1) \cap \cdots \cap (\operatorname{null} \varphi_m) = \{0\}$. And $\operatorname{null} \Gamma = (\operatorname{null} \varphi_1) \cap \cdots \cap (\operatorname{null} \varphi_m)$. Hence Γ inje \Longleftrightarrow $\operatorname{null} \Gamma = \{0\} \Longleftrightarrow \operatorname{span}(\varphi_1, \dots, \varphi_m) = V'$.
- (d) Suppose $(\varphi_1, \ldots, \varphi_m)$ is linely inde. Then by Problem (31), (v_1, \ldots, v_m) is linely inde. Thus $\forall (a_1, \ldots, a_m) \in \mathbb{F}, \exists ! v = \sum_{i=1}^m a_i v_i \in V \Rightarrow \varphi_i(v) = a_i, \Gamma(v) = (a_1, \ldots, a_m)$. Hence Γ is surj. Suppose Γ is surj. Let (e_1, \ldots, e_m) be the std basis of \mathbb{F}^m .

Suppose $v_i \in V$ such that $\Gamma(v_i) = (\varphi_1(v_i), \dots, \varphi_m(v_i)) = e_i$, for each i.

Then $(v_1, ..., v_m)$ is linely inde. And $\varphi_i(v_k) = \delta_{i,k}$.

Now $a_1 \varphi_1 + \dots + a_m \varphi_m = 0 \Rightarrow 0(v_i) = a_i$ for each *i*. Hence $(\varphi_1, \dots, \varphi_m)$ is linely inde.

Or. Let $\operatorname{span}(v_1,\ldots,v_m)=U$. Then $B_{U'}=(\varphi_1|_U,\ldots,\varphi_m|_U)$. Hence $(\varphi_1,\ldots,\varphi_m)$ is linely inde. \square

OR. Similar to Problem (6), we get (e_1, \dots, e_m) , (ψ_1, \dots, ψ_m) and the iso Ψ .

$$\forall (x_1, \dots, x_m) \in \mathbf{F}^m, \Gamma'(\Psi(x_1, \dots, x_m)) = \Gamma'(\Psi(x_1 e_1 + \dots + x_m e_m)) = (x_1 \psi_1 + \dots + x_m \psi_m) \circ \Gamma.$$

$$\forall v \in V, \left[\Gamma'(\Psi(x_1, \dots, x_m))\right](v) = \left[x_1\psi_1 + \dots + x_m\psi_m\right](\Gamma(v)) = \left[x_1\varphi_1 + \dots + x_m\varphi_m\right](v).$$

Now $\Gamma'(\Psi(x_1,\ldots,x_m)) = x_1\varphi_1 + \cdots + x_m\varphi_m$.

Define $\Phi: \mathbb{F}^m \to (\mathbb{F}^m)'$ by $\Phi = \Psi \circ \Gamma$. $\Phi(x_1, \dots, x_m) = x_1 \varphi_1 + \dots + x_m \varphi_m$. Thus by (4E 3.B.3),

- (c) the inje of Φ correspds to $(\varphi_1, \dots, \varphi_m)$ spanning V'; $\nabla \Phi = \Psi \circ \Gamma$ inje $\iff \Gamma$ inje.
- (d) the surj of Φ correspds to $(\varphi_1, ..., \varphi_m)$ being linely inde; $X = \Psi \circ \Gamma$ surj $\iff \Gamma$ surj.

35 *Prove that* $(\mathcal{P}(F))'$ *is iso to* F^{∞} .

SOLUTION:

Define
$$\theta \in \mathcal{L}((\mathcal{P}(\mathbf{F}))', \mathbf{F}^{\infty})$$
 by $\theta(\varphi) = (\varphi(1), \varphi(z), \dots, \varphi(z^n), \dots)$.

Inje:
$$\theta(\varphi) = 0 \Rightarrow \forall z^k$$
 in the basis $(1, z, ..., z^n)$ of $\mathcal{P}_n(\mathbf{F})$ $(\forall n)$, $\varphi(z^k) = 0 \Rightarrow \varphi = 0$.

[Notice that
$$\forall p \in \mathcal{P}(\mathbf{R}), \exists ! a_i \in \mathbf{F}, m = \deg p, \ p = a_0 z + a_1 z + \dots + a_m z^m \in \mathcal{P}_m(\mathbf{F}).$$
]

Surj:
$$\forall (a_k)_{k=1}^{\infty} \in \mathbf{F}^{\infty}$$
, let ψ be such that $\forall k, \psi(z^k) = a_k$ [by [3.5]] and thus $\theta(\psi) = (a_k)_{k=1}^{\infty}$.

Comment: Notice that $\mathcal{P}(F)$ is not iso to F^{∞} , so is $\mathcal{P}(F)$ to $\big(\mathcal{P}(F)\big)'$

But if we let
$$\mathbf{F}^{\infty} = \{(a_1, \cdots, a_n, \underbrace{0, \cdots, 0, \cdots}_{\text{all zero}}) \in \mathbf{F}^{\infty} \mid \exists ! n \in \mathbf{N}^+ \}$$
. Then $\mathcal{P}(\mathbf{F})$ is iso to \mathbf{F}^{∞} .

7 Show that the dual basis of $(1, x, ..., x^m)$ of $\mathcal{P}_m(\mathbf{R})$ is $(\varphi_0, \varphi_1, ..., \varphi_m)$, where $\varphi_k(p) = \frac{p^{(k)}(0)}{k!}$. Here $p^{(k)}$ denotes the k^{th} derivative of p, with the understanding that the 0^{th} derivative of p is p.

SOLUTION:

$$\forall j, k \in \mathbf{N}, \ (x^{j})^{(k)} = \begin{cases} j(j-1) \dots (j-k+1) \cdot x^{(j-k)}, & j \ge k. \\ j(j-1) \dots (j-j+1) = j! & j = k. \\ 0, & j \le k. \end{cases} \text{ Then } (x^{j})^{(k)}(0) = \begin{cases} 0, \ j \ne k. \\ k!, \ j = k. \end{cases}$$

Or. Because
$$\forall j, k \in \{1, ..., m\}$$
 such that $j \neq k$, $\varphi_k(x^j) = \frac{(x^j)^{(k)}(0)}{k!} = \frac{0}{k!} = 0$; $\varphi_k(x^k) = \frac{(x^k)^{(k)}(0)}{k!} = 1$.

Thus $\frac{p^{(k)}(0)}{k!}$ act exactly the same as φ_k on the same basis $(1, ..., x^m)$, hence is just another def of φ_k .

EXAMPLE: Suppose $m \in \mathbb{N}^+$. By [2.C.10], $B = (1, x - 5, ..., (x - 5)^m)$ is a basis of $\mathcal{P}_m(\mathbb{R})$.

Let
$$\varphi_k = \frac{p^{(k)}(5)}{k!}$$
 for each $k = 0, 1, ..., m$. Then $(\varphi_0, \varphi_1, ..., \varphi_m)$ is the dual basis of B .

34 The double dual space of V, denoted by V'', is defined to be the dual space of V'.

In other words, $V'' = \mathcal{L}(V', \mathbf{F})$. Define $\Lambda : V \to V''$ by $(\Lambda v)(\varphi) = \varphi(v)$.

- (a) Show that Λ is a linear map from V to V''.
- (b) Show that if $T \in \mathcal{L}(V)$, then $T'' \circ \Lambda = \Lambda \circ T$, where T'' = (T')'.
- (c) Show that if V is finite-dim, then Λ is an iso from V onto V''.

Suppose V is finite-dim. Then V and V' are iso, and finding an iso from V onto V' generally requires choosing a basis of V. In contrast, the iso Λ from V onto V'' does not require a choice of basis and thus is considered more natural.

SOLUTION:

- (a) $\forall \varphi \in V', v, w \in V, a \in F, (\Lambda(v+aw))(\varphi) = \varphi(v+aw) = \varphi(v) + a\varphi(w) = (\Lambda v)(\varphi) + a(\Lambda w)(\varphi).$ Thus $\Lambda(v+aw) = \Lambda v + a\Lambda w$. Hence Λ is linear.
- (b) $(T''(\Lambda v))(\varphi) = ((\Lambda v) \circ T')(\varphi) = (\Lambda v)(T'(\varphi))$ = $(T'(\varphi))(v) = (\varphi \circ T)(v) = \varphi(Tv) = (\Lambda(Tv))(\varphi).$

Hence $T''(\Lambda v) = (\Lambda(Tv)) \Rightarrow T'' \circ \Lambda = \Lambda \circ T$.

(c) Suppose $\Lambda v = 0$. Then $\forall \varphi \in V'$, $(\Lambda v)(\varphi) = \varphi(v) = 0 \Rightarrow v = 0$. Thus Λ is inje. \mathbb{X} Because V is finite-dim. dim $V = \dim V' = \dim V''$. Hence Λ is an iso.
