### 简介

这是我个人用于复习的笔记,一本习题补注。由于我个人的复习特点,我把许多对我个人而言没什么复习价值的习题作了省略。为什么我没有用中文?因为我将来要学习的绝大多数数学课本都是全英的,国内目前的专业翻译速度慢、不全面,况且对于专业学习者来说,直接使用英文不会造成任何困扰,并且我不愿意花费额外的时间去翻译,所以我用英文。但我讨厌英文单词的冗长性,这会让我复习起来很不爽,所以我对许多常用词汇适当地作了简写。这份习题补注的内容范围和标识说明,我已经在README中写得很清楚,不再赘述。这份笔记尚处于缓慢的编撰进度中。

**1** Prove that  $\forall v \in V, -(-v) = v$ .

Solution:  $\begin{pmatrix} (-(-v)) + (-v) = 0 \\ v + (-v) = 0 \end{pmatrix}$   $\Rightarrow$  By the uniques of add inv.

s of add inv.  $\Box$ 

Or. 
$$-(-v) = (-1)((-1)v) = ((-1)(-1))v = 1 \cdot v = v$$
.

**2** Suppose  $a \in \mathbb{F}$ ,  $v \in V$ , and av = 0. Prove that a = 0 or v = 0.

**SOLUTION**: Suppose  $a \neq 0$ ,  $\exists a^{-1} \in \mathbf{F}$ ,  $a^{-1}a = 1$ , hence  $v = 1 \cdot v = (a^{-1}a)v = a^{-1}(av) = a^{-1} \cdot 0 = 0$ .

**3** Suppose  $v, w \in V$ . Explain why  $\exists ! x \in V, v + 3x = w$ .

**SOLUTION:** 

[Existns] Let  $x = \frac{1}{3}(w - v)$ .

[*Uniques*] Suppose  $v + 3x_1 = w$ ,(I)  $v + 3x_2 = w$  (II). Then (I) - (II)  $: 3(x_1 - x_2) = 0 \Rightarrow x_1 = x_2$ .

Or. 
$$v + 3x = w \Leftrightarrow 3x = w - v \Leftrightarrow x = \frac{1}{3}(w - v)$$
.

**5** *Show that in the def of a vecsp, the add inv condition can be replaced by* [1.29].

Suppose V satisfies all conds in the def, except we've replaced the add inv cond with [1.29]. Prove that the add inv is true.

**SOLUTION:** Using [1.31]. 
$$0v = 0$$
 for all  $v \in V \iff (1 + (-1))v = 1 \cdot v + (-1)v = v + (-v) = 0$ .

**6** Let  $\infty$  and  $-\infty$  denote two distinct objects, neither of which is in R.

Define an add and scalar multi on  $R \cup \{\infty, -\infty\}$  as you could guess.

The operations of real numbers is as usual. While for  $t \in R$  define

$$t\infty = \begin{cases} -\infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t > 0, \end{cases} \qquad t(-\infty) = \begin{cases} -\infty & \text{if } t > 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t < 0, \end{cases}$$

and (I)  $t + \infty = \infty + t = \infty + \infty = \infty$ ,

(II) 
$$t + (-\infty) = (-\infty) + t = (-\infty) + (-\infty) = -\infty$$
,

(III) 
$$\infty + (-\infty) = (-\infty) + \infty = 0$$
.

With these operations of add and scalar multi, is  $\mathbb{R} \cup \{\infty, -\infty\}$  a vecsp over  $\mathbb{R}$ ? Explain.

**SOLUTION**: Not a vecpsp, since the add and scalar mult is not assoc and distr.

By Assoc: 
$$(a + \infty) + (-\infty) \neq a + (\infty + (-\infty))$$
.

Or. By Distr: 
$$\infty = (2 + (-1))\infty \neq 2\infty + (-\infty) = \infty + (-\infty) = 0$$
.

7 Give a nontrivial example of  $U \subseteq \mathbb{R}^2$ ,

U is closed under taking add invs and under add, but U is not a subsp of  $\mathbb{R}^2$ .

**SOLUTION:** Let  $U = \mathbb{Z}^2$ ,  $(\mathbb{Z}^*)^2$ ,  $(\mathbb{Q}^*)^2$ ,  $\mathbb{Q}^2 \setminus \{0\}$ , or  $\mathbb{R}^2 \setminus \{0\}$ .

**8** Give a nontrivial example of  $U \subseteq \mathbb{R}^2$ ,

U is closed under scalar multi, but U is not a subsp of  $\mathbb{R}^2$ .

**SOLUTION**: Let  $U = \{(x, y) \in \mathbb{R}^2 : x = 0 \lor y = 0\}$ .

**9** A function  $f: \mathbb{R} \to \mathbb{R}$  is called periodic if  $\exists p \in \mathbb{N}^+, f(x) = f(x+p)$  for all  $x \in \mathbb{R}$ . Is the set of periodic functions from  $\mathbb{R}$  to  $\mathbb{R}$  a subsp of  $\mathbb{R}^\mathbb{R}$ ? Explain.

**S**OLUTION: Denote the set by S.

Suppose  $h(x) = \cos(x) + \sin(\sqrt{2}x) \in S$ , since  $\cos(x)$ ,  $\sin(\sqrt{2}x) \in S$ .

Assume  $\exists p \in \mathbb{N}^+$  such that h(x) = h(x+p),  $\forall x \in \mathbb{R}$ . Let  $x = 0 \Rightarrow h(0) = h(\pm p) = 1$ .

Thus  $1 = \cos(p) + \sin(\sqrt{2}p) = \cos(p) - \sin(\sqrt{2}p)$ 

$$\Rightarrow \sin(\sqrt{2}p) = 0$$
,  $\cos(p) = 1 \Rightarrow p = 2k\pi, k \in \mathbb{Z}$ , while  $p = \frac{m\pi}{\sqrt{2}}, m \in \mathbb{Z}$ .

Hence 
$$2k = \frac{m}{\sqrt{2}} \Rightarrow \sqrt{2} = \frac{m}{2k} \in \mathbb{Q}$$
. Contradiction!

OR. Because [I] :  $\cos(x) + \sin(\sqrt{2}x) = \cos(x+p) + \sin(\sqrt{2}x + \sqrt{2}p)$ . By differentiating twice, [II] :  $\cos(x) + 2\sin(\sqrt{2}x) = \cos(x+p) + 2\sin(\sqrt{2}x + \sqrt{2}p)$ .

$$[II] - [I] : \sin(\sqrt{2}x) = \sin(\sqrt{2}x + \sqrt{2}p)$$

$$2[I] - [II] : \cos(x) = \cos(x + p)$$

$$\Rightarrow p = \frac{m\pi}{\sqrt{2}} = 2k\pi, \text{ if } x = 0. \text{ Contradicts.}$$

• Suppose  $U, W, V_1, V_2, V_3$  are subsps of V.

 $15 U + U \ni u + w \in U.$ 

$$16 U+W\ni u+w=w+u\in W+U.$$

17 
$$(V_1 + V_2) + V_3 \ni (v_1 + v_2) + v_3 = v_1 + (v_2 + v_3) \in V_1 + (V_2 + V_3).$$

**18** Does the add on the subsps of V have an add identity? Which subsps have add invs?

**SOLUTION:** 

(a) Suppose  $\boldsymbol{\Omega}$  is the additive identity.

For any subsp U of V.  $\Omega \subseteq U + \Omega = U \Rightarrow \Omega \subseteq U$ . Let  $U = \{0\}$ , then  $\Omega = \{0\}$ .

(b) Now suppose *W* is an add inv of  $U \Rightarrow U + W = \Omega$ .

Note that 
$$U + W \supseteq U, W \Rightarrow \Omega \supseteq U, W$$
. Thus  $U = W = \Omega = \{0\}$ .

**11** Prove that the intersection of every collection of subsps of V is a subsp of V.

**SOLUTION:** Suppose  $\{U_{\alpha}\}_{\alpha\in\Gamma}$  is a collection of subsps of V; here  $\Gamma$  is an arbitrary index set.

We show that  $\bigcap_{\alpha \in \Gamma} U_{\alpha}$ , which equals the set of vecs that are in  $U_{\alpha}$  for each  $\alpha \in \Gamma$ , is a subsp of V.

- (-)  $0 \in \bigcap_{\alpha \in \Gamma} U_{\alpha}$ . Nonempty.
- $(\stackrel{\frown}{\_}) u, v \in \bigcap_{\alpha \in \Gamma} U_{\alpha} \Rightarrow u + v \in U_{\alpha}, \ \forall \alpha \in \Gamma \Rightarrow u + v \in \bigcap_{\alpha \in \Gamma} U_{\alpha}.$  Closed under add.
- $(\equiv) \ u \in \bigcap_{\alpha \in \Gamma} U_{\alpha}, \lambda \in \mathbb{F} \Rightarrow \lambda u \in U_{\alpha}, \ \forall \alpha \in \Gamma \Rightarrow \lambda u \in \bigcap_{\alpha \in \Gamma} U_{\alpha}.$  Closed under scalar multi.

Thus  $\bigcap_{\alpha \in \Gamma} U_{\alpha}$  is nonempty subset of V that is closed under add and scalar multi.

**12** Suppose U, W are subsps of V. Prove that  $U \cup W$  is a subsp of  $V \iff U \subseteq W$  or  $W \subseteq U$ . **SOLUTION:** (a) Suppose  $U \subseteq W$ . Then  $U \cup W = W$  is a subsp of V. (b) Suppose  $U \cup W$  is a subsp of V. Suppose  $U \not\subseteq W$  and  $U \not\supseteq W$  ( $U \cup W \neq U$  and W). Then  $\forall a \in U$  but  $a \notin W$ ;  $b \in W$  but  $b \notin U$ .  $a + b \in U \cup W$ . Consider  $a + b \in U \Rightarrow b = (a + b) + (-a) \in U$ , contradicts!  $\Rightarrow U \cup W = U \text{ or } W. \text{ Contradicts!}$ Consider  $a + b \in W \Rightarrow a = (a + b) + (-b) \in W$ , contradicts! Thus  $U \subseteq W$  and  $U \supseteq W$ . **13** *Prove that the union of three subsps of V is a subsp of V* if and only if one of the subsps contains the other two. This exercise is not true if we replace F with a field containing only two elements. **SOLUTION:** Suppose  $U_1$ ,  $U_2$ ,  $U_3$  are subsps of V. Denote  $U_1 \cup U_2 \cup U_3$  by  $\mathcal{U}$ . (a) Suppose that one of the subsps contains the other two. Then  $\mathcal{U} = U_1, U_2$  or  $U_3$  is a subsp of V. (b) Suppose that  $U_1 \cup U_2 \cup U_3$  is a subsp of V. By distinct we notice that  $A \cup B \cup C = (A \cup B) \cup (B \cup C) = (A \cup C) \cup (B \cup C) = (A \cup B) \cup (A \cup C)$ . Also note that, if  $U \cup W = V$  is a vecsp, then in general U and W are not subsps of V. Hence this literal trick is invalid. (I) If any  $U_i$  is contained in the union of the other two, say  $U_1 \subseteq U_2 \cup U_3$ , then  $\mathcal{U} = U_2 \cup U_3$ . By applying Problem (12) we conclude that one  $U_i$  contains the other two. Thus we are done. (II) Assume that no  $U_i$  is contained in the union of the other two, and no  $U_i$  contains the union of the other two. Say  $U_1 \not\subseteq U_2 \cup U_3$  and  $U_1 \not\supseteq U_2 \cup U_3$ .  $\exists u \in U_1 \land u \notin U_2 \cup U_3; \ v \in U_2 \cup U_3 \land v \notin U_1.$  Let  $W = \{v + \lambda u : \lambda \in F\} \subseteq \mathcal{U}.$ Note that  $W \cap U_1 = \emptyset$ , for if  $v + \lambda u \in U_1$  then  $v + \lambda u - \lambda u = v \in U_1$  while  $v \notin U_1$ .  $\forall v + \lambda u \in W, \exists i \in \{2,3\}, v + \lambda u \in U_i.$ Because  $U_2$ ,  $U_3$  are subsps and hence have at least one element. If  $U_2 = U_3$ , then  $\mathcal{U} = U_1 \cup U_2$  and by Problem (12) we are done. Otherwise,  $\exists \lambda, \mu \in F$  with  $\lambda \neq \mu$  such that  $v + \lambda u, v + \mu u \in U_i$  for some  $i \in \{2, 3\}$ . Then  $u \in U_i$  while  $u \notin U_2 \cup U_3$ . Contradicts. Example: Suppose  $U = \{(x, x, y, y) \in \mathbf{F}^4 : x, y \in \mathbf{F}\}, W = \{(x, x, x, y) \in \mathbf{F}^4 : x, y \in \mathbf{F}\}.$ *Prove that*  $U + W = \{(x, x, y, z) \in \mathbb{F}^4 : x, y, z \in \mathbb{F}\}.$ Let T denote  $\{(x, x, y, z) \in \mathbb{F}^4 : x, y, z \in \mathbb{F}\}$ . By def,  $U + W \subseteq T$ . And  $T \ni (x, x, y, z) \Rightarrow (0, 0, y - x, y - x) + (x, x, x, -y + x + z) \in U + W$ . Hence  $T \subseteq U + W$ . 

Let  $W = \{(0,0,z,w,u) \in \mathbb{F}^5 : z,w,u \in \mathbb{F}\}$ . Then  $U \cap W = \{0\}$ . And  $\mathbb{F}^5 \ni (x,y,z,w,u) \Rightarrow (x,y,x+y,x-y,2x) + (0,0,z-x-y,w-x-y,u-2x) \in U+W$ .

**21** Suppose  $U = \{(x, y, x + y, x - y, 2x) \in \mathbf{F}^5 : x, y \in \mathbf{F}\}$ . Find a W such that  $\mathbf{F}^5 = U \oplus W$ .

**SOLUTION:** 

**23** Give an example of vecsps  $V_1, V_2, U$  such that  $V_1 \oplus U = V_2 \oplus U$ , but  $V_1 \neq V_2$ . **SOLUTION**:  $V = \mathbb{F}^2$ ,  $U = \{(x, x) \in \mathbb{F}^2 : x \in \mathbb{F}\}$ ,  $V_1 = \{(x, 0) \in \mathbb{F}^2 : x \in \mathbb{F}\}$ ,  $V_2 = \{(0, x) \in \mathbb{F}^2 : x \in \mathbb{F}\}$ . **22** Suppose  $U = \{(x, y, x + y, x - y, 2x) \in \mathbb{F}^5 : x, y \in \mathbb{F}\}.$ Find three subsps  $W_1$ ,  $W_2$ ,  $W_3$  of  $\mathbf{F}^5$ , none of which equals  $\{0\}$ , such that  $\mathbf{F}^5 = U \oplus W_1 \oplus W_2 \oplus W_3$ . **SOLUTION:** (1) Let  $W_1 = \{(0,0,z,0,0) \in \mathbb{F}^5 : z \in \mathbb{F}\}$ . Then  $W_1 \cap U = \{0\}$ . Let  $U_1 = U \oplus W_1$ . Then  $U_1 = \{(x, y, z, x - y, 2x) \in \mathbb{F}^5 : x, y, z \in \mathbb{F}\}$ . (Check it!) (2) Let  $W_2 = \{(0,0,0,w,0) \in \mathbb{F}^5 : w \in \mathbb{F}\}$ . Then  $W_2 \cap U_1 = \{0\}$ . Let  $U_2 = U_1 \oplus W_2$ . Then  $U_2 = \{(x, y, z, w, 2x) \in \mathbb{F}^5 : x, y, z, w \in \mathbb{F}\}.$ (3) Let  $W_3 = \{(0,0,0,0,u) \in \mathbb{F}^5 : u \in \mathbb{F}\}$ . Then  $W_3 \cap U_2 = \{0\}$ . Let  $U_3 = U_2 \oplus W_3$ . Then  $U_3 = \{(x, y, z, w, u) \in \mathbb{F}^5 : x, y, z, w, u \in \mathbb{F}\}.$ Thus  $\mathbf{F}^5 = ((U \oplus W_1) \oplus W_2) \oplus W_3$ . **24** Let  $V_E = \{ f \in \mathbb{R}^{\mathbb{R}} : f(x) = f(-x) \}$ ,  $V_O = \{ f \in \mathbb{R}^{\mathbb{R}} : -f(x) = f(-x) \}$ . Show that  $V_E \oplus V_O = \mathbb{R}^{\mathbb{R}}$ . **SOLUTION:** (a)  $V_E \cap V_O = \{ f \in \mathbb{R}^{\mathbb{R}} : f(x) = f(-x) = -f(-x) \} = \{ 0 \}.$  $\begin{aligned} f_e \in V_E &\iff f_e(x) = f_e(-x) &\iff \det f_e(x) = \frac{g(x) + g(-x)}{2} \\ f_o \in V_O &\iff f_o(x) = -f_o(-x) &\iff \det f_o(x) = \frac{g(x) - g(-x)}{2} \end{aligned} \right\} \Rightarrow \forall g \in \mathbb{R}^R, g(x) = f_e(x) + f_o(x). \quad \Box$ (b) **ENDED** 2·A A list (v) of length 1 in V is linely inde  $\iff v \neq 0$ . **2** (a) | P | |Q|(b) [P] A list (v, w) of length 2 in V is linely inde  $\iff \forall \lambda, \mu \in \mathbf{F}, v \neq \lambda w, w \neq \mu v$ . Step 1 Pick a  $v_1 \neq 0$ ,  $(v_1)$  linely inde. Step m Pick a  $v_m \notin \text{span}(v_1, ..., v_{m-1})$ , by Problem (10)(b),  $(v_1, ..., v_m)$  is linely inde. This process recursively defines the desired sequence  $(v_1, v_2, ...)$ .  $\neg P \Rightarrow \neg Q$ : Suppose *V* is finite-dim and *V* = span  $(w_1, ..., w_m)$ . Let  $(v_1, v_2, \dots)$  be a sequence in V, then  $(v_1, v_2, \dots, v_{m+1})$  must be linely dep. Or.  $Q \Rightarrow P$ : Suppose there is such a sequence. Choose an m. Suppose a linely inde list  $(v_1, ..., v_m)$  spans V. (Similar to [2.16]) Then  $\exists v_{m+1} \in V \setminus \text{span}(v_1, ..., v_m)$ . Hence no list spans *V* . Thus *V* is infinite-dim. **16** Prove that the vecsp of all continuous functions in  $\mathbb{R}^{[0,1]}$  is infinite-dim. **SOLUTION**: Denote the vecsp by U. Choose an  $m \in \mathbb{N}^+$ . Suppose  $a_0, \dots, a_m \in \mathbb{R}$  are such that  $a_0 + a_1x + \dots + a_mx^m = 0$ ,  $\forall x \in [0, 1]$ . Then the poly has infinitely many roots and hence  $a_0 = \cdots = a_m = 0$ . Thus  $(1, x, ..., x^m)$  is linely inde in  $\mathbb{R}^{[0,1]}$ . Similar to [2.16], U is infinite-dim. OR. Note that for  $a_n = \frac{1}{n}$ ,  $a_1 < a_2 < \dots < a_m$ ,  $\forall m \in \mathbb{N}^+$ . Suppose  $f_n = \begin{cases} x - \frac{1}{n}, & x \in \left(\frac{1}{n}, 1\right) \\ 0, & x \in \left[0, \frac{1}{n}\right] \end{cases}$  Then for any  $m, f_1\left(\frac{1}{m}\right) = \dots = f_m\left(\frac{1}{m}\right)$ , while  $f_{m+1}\left(\frac{1}{m}\right) \neq 0$ . Hence  $f_{m+1} \notin \text{span}(f_1, \dots, f_m)$ . Thus by Problem (14), U is infinite-dim. **17** Suppose  $p_0, p_1, \ldots, p_m \in \mathcal{P}_m(\mathbf{F})$  such that  $p_k(2) = 0$  for each  $k \in \{0, \ldots, m\}$ . *Prove that*  $(p_0, p_1, ..., p_m)$  *is not linely inde in*  $\mathcal{P}_m(\mathbf{F})$ . **SOLUTION:** Suppose  $(p_0, p_1, ..., p_m)$  is linely inde. Define  $p \in \mathcal{P}_m(\mathbf{F})$  by  $p(z) = z \ \forall z \in \mathbf{F}$ . But  $\forall a_i \in F, z \neq a_0 p_0(z) + \dots + a_m p_m(z)$ , for if not, let z = 2, contradicts. Thus  $z \notin \text{span}(p_0, p_1, \dots, p_m)$ . Then span  $(p_0, p_1, \dots, p_m) \subseteq \mathcal{P}_m(\mathbf{F})$  while the list  $(p_0, p_1, \dots, p_m)$  has length (m + 1). Hence  $(p_0, p_1, \dots, p_m)$  is linely depe in  $\mathcal{P}_m(\mathbf{F})$ . For if not, because  $(1, z, ..., z^m)$  of length (m + 1) spans  $\mathcal{P}_m(\mathbf{F})$ , thus by [2.23] trivially,  $(p_0, p_1, \dots, p_m)$  spans  $\mathcal{P}_m(\mathbf{F})$ . Contradicts. OR. Note that  $\mathcal{P}_m(\mathbf{F}) = \operatorname{span} \underbrace{(1, z, \dots, z^m)}_{\text{of length } (m+1)}$  and then  $(p_0, p_1, \dots, p_m, x)$  of length (m+2) is linely dep. (See the above ) Now  $z \notin \text{span}(p_0, p_1, \dots, p_m)$  and hence  $(p_0, p_1, \dots, p_m)$  is linely dep. 

7	Prove or give a counterexample: If $v_1, v_2, v_3$	$v_{4}$	is a basis of	V and $U$ is a subsp of $V$
	such that $v_1, v_2 \in U$ and $v_3 \notin U$ and $v_4 \notin$	U, t	then $(v_1, v_2)$	is a basis of U.

**SOLUTION:** A counterexample:

Let  $V = \mathbb{R}^4$  and  $e_i$  be the  $j^{\text{th}}$  standard basis.

Let 
$$v_1 = e_1, v_2 = e_2, v_3 = e_3 + e_4, v_4 = e_4$$
. Then  $(v_1, \dots, v_4)$  is a basis of  $\mathbb{R}^4$ .

Let 
$$U = \operatorname{span}(e_1, e_2, e_3) = \operatorname{span}(v_1, v_2, v_3 - v_4)$$
. Then  $v_3 \notin U$  and  $(v_1, v_2)$  is not a basis of  $U$ .

## • Note for " $C_V U \cap \{0\}$ ":

" $C_V U \cap \{0\}$ " is supposed to be a subsp W such that  $V = U \oplus W$ .

But if we let 
$$u \in U \setminus \{0\}$$
 and  $w \in W \setminus \{0\}$ , then  $\begin{cases} w \in C_V U \cap \{0\} \\ u \pm w \in C_V U \cap \{0\} \end{cases} \Rightarrow u \in C_V U \cap \{0\}$ . Contradicts.

To fix this, denote the set  $\{W_1, W_2 \dots\}$  by  $\mathcal{S}_V U$ , where for each  $W_i$ ,  $V = U \oplus W_i$ . See also in (1.C.23).

**1** Find all vecsps that have exactly one basis.

**SOLUTION**: The trivial vecsp  $\{0\}$  will do. Indeed, the only basis of  $\{0\}$  is the empty list.

Now consider a field containing only the add identity 0 and the multi identity 1, and we specify that 1+1=0. Hence the vecsp  $\{0,1\}$  will do, the list (1) will be the unique basis.

Are there other vecsps? Suppose so.

- (I) Consider F = R or C. Let  $(v_1, \dots, v_m)$  be a basis of  $V \neq \{0\}$ . While there are infinitely many bases distinct from this one. Hence we fail.
- (II) Consider other **F**. Note that a field contains at least 0 and 1 By *some theories or facts* given in the course of Elementary Abstract Algebra, we fail.
- Suppose  $(v_1, ..., v_m)$  is a list of vecs in V. For  $k \in \{1, ..., m\}$ , let  $w_k = v_1 + \cdots + v_k$ . Show that  $[P](v_1, ..., v_m)$  is a basis of  $V \iff [Q](w_1, ..., w_m)$  is a basis of V.

**Solution**: Notice that  $(u_1, \dots, u_n)$  is a basis of  $U \iff \forall u \in U, \exists ! a_i \in F, u = a_1u_1 + \dots + a_nu_n$ .

$$P \Rightarrow Q: \ \forall v \in V, \ \exists \,! \, a_i \in \mathbb{F}, \ v = a_1 v_1 + \dots + a_m v_m \Rightarrow v = b_1 w_1 + \dots + b_m v_m, \ \exists \,! \, b_1 = a_1, b_k = \sum_{j=1}^k (-1)^{k-j} a_j.$$

$$Q \Rightarrow P: \ \forall v \in V, \ \exists \,! \, b_i \in \mathbf{F}, \ v = b_1 w_1 + \dots + b_m w_m \Rightarrow v = a_1 v_1 + \dots + a_m v_m, \ \exists \,! \, a_k = \sum_{j=1}^k b_j.$$

• Suppose V is finite-dim and U, W are subsps of V such that V = U + W. Prove that there exists a basis of V consisting of vecs in  $U \cup W$ .

**SOLUTION:** Let  $(u_1, ..., u_m)$  and  $(w_1, ..., w_n)$  be bases of U and W respectively.

Then 
$$V = \text{span}(u_1, ..., u_m) + \text{span}(w_1, ..., w_n) = \text{span}(u_1, ..., u_m, w_1, ..., w_n).$$

Hence, by [2.31], we get a basis of V consisting of vecs in U or W.

**8** Suppose U and W are subsps of V such that  $V = U \oplus W$ . Suppose  $(u_1, ..., u_m)$  is a basis of U and  $(w_1, ..., w_n)$  is a basis of W. Prove that  $(u_1, ..., u_m, w_1, ..., w_n)$  is a basis of V.

**SOLUTION:** 

$$\forall v \in V, \exists ! u \in U, w \in W, v = u + w = (a_1u_1 + \dots + a_mu_m) + (b_1w_1 + \dots + b_nw_n), \exists ! a_i, b_i \in \mathbf{F}$$
 
$$\Rightarrow (a_1u_1 + \dots + a_mu_m) = -(b_1w_1 + \dots + b_nw_n) \in U \cap W = \{0\}. \text{ Thus } a_1 = \dots = a_m = b_1 = \dots = b_n. \quad \Box$$

• **Note For** *linely inde sequence and* [2.34]:

" $V = \text{span}(v_1, \dots, v_n, \dots)$ " is an invalid expression.

If we allow using "infinite list", then we must guarantee that  $(v_1, \dots, v_n, \dots)$  is a spanning "list" such that for all  $v \in V$ , there exists a smallest positive integer n such that  $v = a_1v_1 + \dots + a_nv_n$ , The key point is, how can we guarantee that such a "list" exists?

**1** ( COROLLARY for [2.38,39] )

Suppose U is a subsp of V such that dim  $V = \dim U$ . Then V = U.

**9** Suppose  $(v_1, ..., v_m)$  is linely inde in V and  $w \in V$ . Prove that dim span  $(v_1 + w, ..., v_m + w) \ge m - 1$ .

**SOLUTION:** Using the result of Problem (10) and (11) in 2.A.

Note that  $v_i - v_1 = (v_i + w) - (v_1 + w) \in \text{span}(v_1 + w, ..., v_n + w)$ , for each i = 1, ..., m.

 $(v_1, \dots, v_m)$  linely inde  $\Rightarrow (v_1, v_2 - v_1, \dots, v_m - v_1)$  linely inde  $\Rightarrow (\underbrace{v_2 - v_1, \dots, v_m - v_1})$  linely inde.

 $\not \subseteq w \notin \operatorname{span}(v_1, \dots, v_m) \Rightarrow (v_1 + w, \dots, v_m + w)$  is linely inde.

Hence  $m \ge \dim \operatorname{span}(v_1 + w, \dots, v_m + w) \ge m - 1$ .

**10** Suppose m is a positive integer and  $p_0, p_1, \ldots, p_m \in \mathcal{P}(\mathbf{F})$  are such that each  $p_k$  has degree k. Prove that  $(p_0, p_1, \ldots, p_m)$  is a basis of  $\mathcal{P}_m(\mathbf{F})$ .

**SOLUTION:** 

Using mathematical induction on *m*.

- (i) For  $p_0$ , deg  $p_0 = 0 \Rightarrow \text{span}(p_0) = \text{span}(1)$ .
- (ii) Suppose for  $i \ge 1$ , span  $(p_0, p_1, ..., p_i) = \text{span } (1, x, ..., x^i)$ .

Then span  $(p_0, p_1, ..., p_i, p_{i+1}) \subseteq \text{span } (1, x, ..., x^i, x^{i+1}).$ 

 $\mathbb{Z} \deg p_{i+1} = i+1, \quad p_{i+1}(x) = a_{i+1}x^{i+1} + r_{i+1}(x); \quad a_{i+1} \neq 0, \quad \deg r_{i+1} \leq i.$ 

$$\Rightarrow x^{i+1} = \frac{1}{a_{i+1}} \left( p_{i+1}(x) - r_{i+1}(x) \right) \in \text{span} \left( 1, x, \dots, x^i, p_{i+1} \right) = \text{span} \left( p_0, p_1, \dots, p_i, p_{i+1} \right).$$

$$\therefore x^{i+1} \in \operatorname{span}(p_0, p_1, \dots, p_i, p_{i+1}) \Rightarrow \operatorname{span}(1, x, \dots, x^i, x^{i+1}) \subseteq \operatorname{span}(p_0, p_1, \dots, p_i, p_{i+1}).$$

Thus 
$$\mathcal{P}_m(\mathbf{F}) = \operatorname{span}(1, x, \dots, x^m) = \operatorname{span}(p_0, p_1, \dots, p_m).$$

Or. 用比较系数法. Denote the coefficient of  $x^i$  in  $p \in \mathcal{P}(\mathbf{F})$  by  $\xi_i(p)$ .

Suppose  $L = a_m p_m(x) + \dots + a_1 p_1(x) + a_0 p_0(x) = 0 \cdot x^m + \dots + 0 \cdot x + 0 \cdot 1 = R, \forall x \in \mathbf{F}.$ 

We use induction on m to show that  $a_m = \cdots = a_0 = 0$ .

- (i) k = m,  $\xi_m(L) = a_m \xi_m(p_m) = \xi_m(R) = 0 \ \ \ \ \deg p_m = m$ ,  $\xi_m(p_m) \neq 0 \Rightarrow a_m = 0$ . Now  $L = a_{m-1} p_{m-1}(x) + \dots + a_0 p_0(x)$ .
- (ii)  $1 \le k \le m$ ,  $\xi_k(L) = a_k \xi_k(p_k) = \xi_k(R) = 0 \ \ \ \ \ \deg p_k = k$ ,  $\xi_k(p_k) \ne 0 \Rightarrow a_k = 0$ . Now  $L = a_{k-1} p_{k-1}(x) + \dots + a_0 p_0(x)$ .

• (4E 2.C.10) Suppose m is a positive integer. For  $0 \le k \le m$ , let  $p_k(x) = x^k (1-x)^{m-k}$ . Show that  $(p_0, ..., p_m)$  is a basis of  $\mathcal{P}(\mathbf{F})$ .

The basis in this exercise leads to what are called Bernstein polynomials. You can do a web search to learn how Bernstein polynomials are used to approximate continuous functions on [0,1].

**SOLUTION:** Using mathematical induction.

(i) 
$$k = 0, 1, 2, p_m(x) = x^m, p_{m-1}(x) = x^{m-1} - x^m, p_{m-2}(x) = x^{m-2} + x^m - 2x^{m-1}$$

(ii) 
$$k \ge 2$$
. Suppose for  $p_{m-k}(x)$ ,  $\exists ! a_i \in \mathbf{F}$ ,  $x^{m-k} = p_{m-k}(x) + a_m x^m + \dots + a_{m-k+1} x^{m-k+1}$ .

Then for  $p_{m-k-1}(x)$ ,  $\exists ! c_i \in \mathbf{F}$ ,

$$\begin{split} x^{m-k-1} &= p_{m-k-1}(x) + C_{k+1}^1(-1)^2 x^{m-k} + \dots + C_{k+1}^k(-1)^{k+1} x^{m-1} + (-1)^{k-2} x^m \\ \Rightarrow c_{m-i} &= C_{k+1}^{k+1-i} (-1)^{k-i}. \end{split}$$

Thus for each 
$$x^i$$
,  $\exists ! b_i \in \mathbf{F}, x^i = b_m p_m(x) + \dots + b_{m-i} p_{m-i}(x)$ 

$$\Rightarrow \operatorname{span}(x^m, \dots, x, 1) = \operatorname{span}\underbrace{(p_m, \dots, p_1, p_0)}_{\text{Basis}}.$$

For any  $m, k \in \mathbb{N}^+$  such that  $k \leq m$ . Define  $p_{k,m}$  by  $p_{k,m}(x) = x^k (1-x)^{m-k}$ .

Define the statement S(m) by  $S(m):(p_{0,m},...,p_{m,m})$  is linely inde (and therefore is a basis).

We use induction on to show that S(m) holds for all  $m \in \mathbb{N}^+$ .

(i) 
$$m = 1$$
. Suppose  $a_0(1-x) + a_1x = 0$ ,  $\forall x \in \mathbf{F}$ . Then 
$$\begin{cases} x = 0 \Rightarrow a_0 = 0; \\ x = 1 \Rightarrow a_1. \end{cases}$$

$$m = 2$$
. Suppose  $a_0(1-x)^2 + a_1(1-x)x + a_2x^2$ ,  $\forall x \in \mathbf{F}$ . Then 
$$\begin{cases} x = 0 \Rightarrow a_0 + a_1 = 0; \\ x = 1 \Rightarrow a_2 = 0; \\ x = 2 \Rightarrow a_0 + 2a_1 = 0. \end{cases}$$

(ii)  $2 \le m$ . Assume that S(m) holds.

Suppose 
$$\sum_{k=0}^{m+2} a_k p_{k,m+2}(x) = \sum_{k=0}^{m+2} a_k x^k (1-x)^{m+2-k} = 0, \forall x \in \mathbf{F}.$$

While 
$$x = 0 \Rightarrow a_0 = 0$$
;  $x = 1 \Rightarrow a_{m+2} = 0$ . Then  $\sum_{k=1}^{m+1} a_k x^k (1-x)^{m+2-k} = 0$ ;

And note that 
$$\sum_{k=1}^{m+1} a_k x^k (1-x)^{m+2-k}$$

$$= x(1-x)\sum_{k=1}^{m+1} a_k x^{k-1} (1-x)^{m+1-k}$$

$$=x(1-x)\sum_{k=0}^m a_{k+1}x^k(1-x)^{m-k}=x(1-x)\sum_{k=0}^m a_{k+1}p_{k,m}(x).$$

Hence 
$$x(1-x) \sum_{k=0}^{m} a_{k+1} p_{k,m}(x) = 0, \forall x \in \mathbf{F} \Rightarrow \sum_{k=0}^{m} a_{k+1} p_{k,m}(x) = 0, \forall x \in \mathbf{F} \setminus \{0,1\}.$$

Hence  $x(1-x) \sum_{k=0}^{m} a_{k+1} p_{k,m}(x) = 0$ ,  $\forall x \in \mathbb{F} \Rightarrow \sum_{k=0}^{m} a_{k+1} p_{k,m}(x) = 0$ ,  $\forall x \in \mathbb{F} \setminus \{0,1\}$ . Because  $\sum_{k=0}^{m} a_{k+1} p_{k,m}(x)$  has infinitely many zeros. We have  $\sum_{k=0}^{m} a_{k+1} p_{k,m}(x) = 0$ ,  $\forall x \in \mathbb{F}$ .

By assumption,  $a_1 = \cdots = a_m = 0$ , while  $a_0 = a_{m+2} = 0$ ,

and also 
$$a_{m+1} = 0$$
 (because  $\sum_{k=0}^{m} a_{k+1} p_{k,m}(x) = a_{m+1} p_{m,m}(x) = a_{m+1} x^m = 0$ ,  $\forall x \in \mathbf{F}$ .)

Thus  $(p_{0,m+2}, \dots, p_{m+2,m+2})$  is linely inde and S(m+2) holds.

Since 
$$S(m) \Rightarrow S(m+2)$$
 for all  $m \in \mathbb{N}^+$ . We have 
$$\begin{cases} S(1) \Rightarrow S(3) \Rightarrow \cdots \Rightarrow S(2k+1) \Rightarrow \cdots; \\ S(2) \Rightarrow S(4) \Rightarrow \cdots \Rightarrow S(2k) \Rightarrow \cdots. \end{cases}$$

Hence S(m) holds for all  $m \in \mathbb{N}^+$ .

### • (4E 2.C.16)

Suppose V is finite-dim and U is a subsp of V with  $U \neq V$ . Let  $n = \dim V$ ,  $m = \dim U$ . Prove that there exist (n - m) subsps of V, say  $U_1, \ldots, U_{n-m}$ , each of dimension (n - 1), such that  $\bigcap_{i=0}^{n-m} U_i = U$ .

### **SOLUTION:**

Let  $(v_1, \ldots, v_m)$  be a basis of U, extend to a basis of V as  $(v_1, \ldots, v_m, u_1, \ldots, v_{n-m})$ .

Define  $U_i = \operatorname{span}(v_1, \dots, v_m, u_1, \dots, u_{i-1}, u_{i+1}, \dots, u_{n-m})$  for each i. Then  $U \subseteq U_i$  for each i.

And because  $\forall v \in \bigcap_{i=1}^{n-m} U_i, v = v_0 + b_1 u_1 + \dots + b_{n-m} u_{n-m} \in U_i \Rightarrow b_i = 0$  for each  $i \Rightarrow v \in U$ .

Hence 
$$\bigcap_{i=1}^{n-m} U_i \subseteq U$$

**SOLUTION:** 

Let  $(v_1, \dots, v_n)$  be a basis of V. Let  $(w_1, \dots, w_m)$  be linely inde in W for any  $m \in \mathbb{N}^+$ .

Define  $T_{x,y} \in \mathcal{L}(V, W)$  by  $T_{x,y}(v_z) = \delta_{zy} w_y$ ,  $\forall x \in \{1, ..., n\}, y \in \{1, ..., m\}$ , where  $\delta_{zy} = \begin{cases} 0, & z \neq y, \\ 1, & z = y. \end{cases}$

 $\Rightarrow$   $a_1 = \cdots = a_m = 0$ . 又 m arbitrary.

Thus  $(T_{x,1}, \dots, T_{x,m})$  is a linely inde list in  $\mathcal{L}(V, W)$  for any x and length m. Hence by (2.A.14).

**13** Suppose  $(v_1, ..., v_m)$  is linely depe in V and  $W \neq \{0\}$ .

*Prove that there exists a list*  $w_1, ..., w_m \in W$ 

such that  $\nexists T \in \mathcal{L}(V, W), Tv_k = w_k, \forall k = 1, ..., m$ .

**SOLUTION:** 

We prove by contradiction. By linear dependence lemma,  $\exists j \in \{1, ..., m\}$  such that  $v_j \in \text{span}(v_1, ..., v_{j-1})$ .

Fix *j*. Let  $w_j \neq 0$ , while  $w_1 = \dots = w_{j-1} = w_{j+1} = w_m = 0$ .

Define *T* by  $Tv_k = w_k$  for all *k*. Suppose  $a_1v_1 + \cdots + a_mv_m = 0$  (where  $a_i \neq 0$ ).

Then  $T(a_1v_1 + \cdots + a_mv_m) = 0 = a_1w_1 + \cdots + a_mw_m = a_iw_i$  while  $a_i \neq 0$  and  $w_i \neq 0$ . Contradicts.  $\square$ 

OR. We prove the contrapositive:

Suppose for any list  $(w_1, ..., w_m) \in W$ ,  $\exists T \in \mathcal{L}(V, W), Tv_k = w_k$  for each  $w_k$ .

(We need to) Prove that  $(v_1, \ldots, v_n)$  is linely inde.

Suppose  $\exists a_i \in \mathbf{F}, a_1v_1 + \dots + a_nv_n = 0$ . Choose a nonzero  $w \in W$ .

By assumption, for the list  $(\overline{a_1}w, ..., \overline{a_m}w)$ ,  $\exists T \in \mathcal{L}(V, W), Tv_k = \overline{a_k}w$  for each  $v_k$ .

Now we have  $0 = T(\sum_{k=1}^{m} a_k v_k) = \sum_{k=1}^{m} a_k T v_k = \sum_{k=1}^{m} a_k \overline{a_k} w = (\sum_{k=1}^{m} |a_k|^2) w$ .

Then  $\sum_{k=1}^{m} |a_k|^2 = 0 \Rightarrow a_k = 0$  for each k. This contradicts the linely dep of  $(v_1, \dots, v_n)$ .

• OR(3.D.16) Suppose V is finite-dim and  $T \in \mathcal{L}(V)$ . Suppose ST = TS for every  $S \in \mathcal{L}(V)$ . Prove that T is a scalar multi of the identity.

### **SOLUTION:**

If  $V = \{0\}$ , then we are done. Now suppose  $V \neq \{0\}$ .

Assume that (v, Tv) is linely depe for every  $v \in V$ , then by (2.A.2.(b)),  $Tv = \lambda_v v$  for some  $\lambda_v \in F$ . To prove that  $\lambda_v$  is independent of v

( in other words, for any two distinct v, w in  $V \setminus \{0\}$ , we have  $\lambda_v \neq \lambda_w$  ), we discuss in two cases:

$$(-) \text{ If } (v,w) \text{ is linely inde, } \lambda_{v+w}(v+w) = T(v+w) = Tv + Tw = a_vv + a_ww \\ \Rightarrow (\lambda_{v+w} - \lambda_v)v + (\lambda_{v+w} - \lambda_w)w = 0 \\ (=) \text{ Otherwise, suppose } w = cv, a_ww = Tw = cTv = ca_vv = a_vw \Rightarrow (a_w - a_v)w \end{cases} \Rightarrow a_w = a_v$$

Now we prove the assumption by contradiction. Suppose (v, Tv) is linely inde for every  $v \in V \setminus \{0\}$ . Fix one v. Extend to  $(v, Tv, u_1, \dots, u_n)$  a basis of V.

Define 
$$S \in \mathcal{L}(V)$$
 by  $S(av + bTv + c_1u_1 + \dots + c_nu_n) = bv \Rightarrow S(Tv) = v = T(Sv) = 0$ . Contradicts.  $\square$ 

Or. Let  $(v_1, \dots, v_m)$  be a basis of V.

Define 
$$\varphi \in \mathcal{L}(V, \mathbf{F})$$
 by  $\varphi(v_1) = \cdots = \varphi(v_m) = 1$ . Let  $\lambda = \varphi(Tv_1) \in \mathbf{F}$ .

For any  $v \in V$ , define  $S_v \in \mathcal{L}(V)$  by  $S_v u = \varphi(u)v$ .

Then 
$$Tv = T(\varphi(v_1)v) = T(S_v v_1) = S_v(Tv_1) = \varphi(Tv_1)v = \lambda v.$$

<b>16</b> Suppose there exists a linear map on V
whose null space and range are both finite-dim. Prove that $V$ is finite-dim.
Solution:
Denote the linear map by $T$ . Let $(Tv_1,, Tv_n)$ be a basis of range $T$ , $(u_1,, u_m)$ be a basis of null $T$ .
Then for all $v \in V$ , $T(\underbrace{v - a_1v_1 - \dots - a_nv_n}) = 0$ , where $Tv = a_1Tv_1 + \dots + a_nTv_n$ .
$\Rightarrow u = b_1 u_1 + \dots + b_m u_m \Rightarrow v = a_1 v_1 + \dots + a_n v_n + b_1 u_1 + \dots + b_m u_m.$
Getting $V \subseteq \text{span}(v_1, \dots, v_n, u_1, \dots, u_m)$ . Thus $V$ is finite-dim.

- (a) Suppose dim V = 5, S,  $T \in \mathcal{L}(V)$  are such that ST = 0. Prove that dim range  $TS \leq 2$ .
  - (b) Give an example of  $S, T \in \mathcal{L}(\mathbf{F}^5)$  with ST = 0 and dim range TS = 2.

### **SOLUTION:**

By Problem (23), dim range  $TS \le \min \left\{ \frac{5 - \dim \text{null } T}{\dim \text{ range } S}, \frac{5 - \dim \text{null } S}{\dim \text{ range } T} \right\}$ .

We show that dim range  $TS \le 2$  by contradiction. Assume that dim range  $TS \ge 3$ .

Then  $\min \{5 - \dim \operatorname{null} T, 5 - \dim \operatorname{null} S\} \ge 3 \Rightarrow \max \{\dim \operatorname{null} T, \dim \operatorname{null} S\} \le 2$ .

 $\mathbb{Z}$  dim null  $ST = 5 \le \dim \text{null } S + \dim \text{null } T \le 4$ . Contradicts.

OR.  $\left. \begin{array}{l} \dim \operatorname{null} S = 5 - \dim \operatorname{range} S \\ \dim \operatorname{range} TS \leq \dim \operatorname{range} S \end{array} \right\} \Rightarrow \dim \operatorname{null} S \leq 5 - \dim \operatorname{range} TS.$ 

And  $ST = 0 \Rightarrow \operatorname{range} T \subseteq \operatorname{null} S \Rightarrow \operatorname{dim} \operatorname{range} TS \leq \operatorname{dim} \operatorname{range} T \leq \operatorname{dim} \operatorname{null} S$ .

Thus dim range  $TS \le 5$  – dim range  $TS \Rightarrow$  dim range  $TS \le \frac{5}{2}$ .

• Suppose dim V = n and  $S, T \in \mathcal{L}(V)$  are such that ST = 0. Prove that dim range  $TS \leq \left\lfloor \frac{n}{2} \right\rfloor$ .

### SOLUTION:

By Problem (23), dim range  $TS \le \min \left\{ \frac{n - \dim \text{null } T}{\dim \text{ range } S}, \frac{n - \dim \text{ null } S}{\dim \text{ range } T} \right\}$ . We prove by contradiction.

Assume that dim range  $TS \ge \left\lfloor \frac{n}{2} \right\rfloor + 1$ .

Then min  $\{n - \dim \operatorname{null} T, n - \dim \operatorname{null} S\} \ge \left\lfloor \frac{n}{2} \right\rfloor + 1$ 

$$\Rightarrow$$
 max {dim null  $T$ , dim null  $S$ }  $\leq n - \left\lfloor \frac{n}{2} \right\rfloor - 1$ .

 $\mathbb{X}$  dim null  $ST = n \le \dim \text{null } S + \dim \text{null } T \le 2(n - \left\lfloor \frac{n}{2} \right\rfloor - 1)$ 

$$\Rightarrow \left\lfloor \frac{n}{2} \right\rfloor + 1 \leq \frac{n}{2}$$
. Contradicts. Thus dim range  $TS \leq \left\lfloor \frac{n}{2} \right\rfloor$ .

OR. dim null  $S = n - \dim \operatorname{range} S \le n - \dim \operatorname{range} TS$ .

And  $ST = 0 \Rightarrow \dim \operatorname{range} TS \leq \dim \operatorname{range} T \leq \dim \operatorname{null} S \leq n - \dim \operatorname{range} TS$ 

$$\Rightarrow 2 \dim \operatorname{range} TS \le n \Rightarrow \dim \operatorname{range} TS \le \frac{n}{2}$$

 $\Rightarrow$  dim range  $TS \le \left\lfloor \frac{n}{2} \right\rfloor$  (because dim range TS is an integer).

This may seems strange. Here we explain why.

 $\varphi \neq 0 \Rightarrow \varphi(v_i) = a_i \neq 0$  for each  $v_i$ , for some linely inde list  $(v_1, \dots, v_k)$ .

Fix one 
$$v_k$$
. Then  $\varphi\left(v_k - \frac{a_k}{a_j}v_j\right) = 0$  for each  $j = 1, ..., k - 1, k + 1, ..., n$ .

Thus span  $\left\{v_k - \frac{a_k}{a_j}v_j\right\}_{j \neq k} \subseteq \text{null } \varphi$ . Hence every vecsp in  $\mathcal{S}_V$  null  $\varphi$  is one-dim.

Suppose  $T = \lambda S$ . Then  $w_1 = Tv_1 = \lambda Sv_1 = \lambda w_1 \Rightarrow \lambda = 1$ .

While 
$$w_2 = Tv_2 = \lambda Sv_2 = 2\lambda w_2 \Rightarrow \lambda = \frac{1}{2}$$
. Contradicts.

• Suppose V is finite-dim with dim V > 1. Show that if  $\varphi : \mathcal{L}(V) \to \mathbf{F}$  is a linear map such that  $\varphi(ST) = \varphi(S) \cdot \varphi(T)$  for all  $S, T \in \mathcal{L}(V)$ , then  $\varphi = 0$ .

**SOLUTION:** Using notations in (4E 3.A.16).

Suppose  $\varphi \neq 0 \Rightarrow \exists i, j \in \{1, ..., n\}, \varphi(R_{i,j}) \neq 0$ .

Because 
$$R_{i,j} = R_{x,j} \circ R_{i,x}, \ \forall x = 1, ..., n$$

$$\Rightarrow \varphi(R_{i,i}) = \varphi(R_{x,i}) \cdot \varphi(R_{i,x}) \neq 0 \Rightarrow \varphi(R_{x,i}) \neq 0 \text{ and } \varphi(R_{i,x}) \neq 0.$$

Again, because  $R_{i,x} = R_{y,x} \circ R_{i,y}$ ,  $\forall y = 1, ..., n$ . Thus  $\varphi(R_{y,x}) \neq 0$  for any x, y = 1, ..., n.

Let  $l \neq i, k \neq j$  and then  $\varphi(R_{l,k} \circ R_{i,j}) = \varphi(0) = 0 = \varphi(R_{l,k}) \cdot \varphi(R_{i,j})$ 

$$\Rightarrow \varphi(R_{l,k}) = 0 \text{ or } \varphi(R_{i,j}) = 0.$$
 Contradicts.

Or. Note that by (4E 3.A.16),  $\exists S, T \in \mathcal{L}(V), ST - TS \neq 0$ .

Then 
$$\varphi(ST - TS) = \varphi(S)\varphi(T) - \varphi(T)\varphi(S) = 0 \Rightarrow ST - TS \in \text{null } \varphi \neq \{0\}.$$

Thus  $\forall E \in \text{null } \varphi, T \in \mathcal{L}(V), \varphi(ET) = \varphi(TE) = 0 \Rightarrow ET, TE \in \text{null } \varphi.$

*Prove that* A = CR,  $\exists C \in \mathbf{F}^{m,c}$ ,  $R \in \mathbf{F}^{c,n}$ .

**SOLUTION**: Notice that  $A \neq 0 \Rightarrow c, r \geq 1$ .

Let  $(C_{.1},...,C_{.s})$  be a basis of  $S_c$ , forming  $C \in \mathbb{F}^{m,c}$ .

Or. Let  $(R_1, ..., R_r)$  be a basis of  $S_r$ , forming  $R \in \mathbf{F}^{c,n}$ .

Then for any k,  $A_{\cdot,k} = R_{1,k}C_{\cdot,1} + \cdots + R_{c,k}C_{\cdot,c} = (CR)_{\cdot,k}$ ,  $\exists ! R_{1,k}, \dots, R_{c,k} \in \mathbf{F}$ , forming  $R \in \mathbf{F}^{c,n}$ .

Now we have A = CR.

#### **EXAMPLE:**

$$A = \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \\ 46 & 33 & 20 & 7 \end{pmatrix} \stackrel{(1)}{=} \begin{pmatrix} 1 & 0 \\ 0 & 1 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 10 & 7 & 4 & 1 \\ 26 & 19 & 12 & 5 \end{pmatrix} \stackrel{(2)}{=} \begin{pmatrix} 7 & 4 \\ 19 & 12 \\ 33 & 20 \end{pmatrix} \begin{pmatrix} 2 & -1 \\ 1 & 0 \\ 0 & 1 \\ -1 & 2 \end{pmatrix}$$

**SOLUTION**: Using TIPS in 2.*C*.

T is inje  $\iff$  dim  $V = \dim \operatorname{range} T + \dim \operatorname{null} T = \dim \operatorname{range} T$ 

$$\Delta \left\{ \begin{array}{l} \Longleftrightarrow (Tu_1, \ldots, Tu_n) \text{ is a basis of } V; \text{ dim range } T = \dim \operatorname{span} \left( \mathcal{M}(Tu_1), \ldots, \mathcal{M}(Tu_n) \right) = n \\ \Leftrightarrow \left( \mathcal{M}(Tu_1), \ldots, \mathcal{M}(Tu_n) \right) \text{ is a basis of } \mathbf{F}^{n,1}, \text{ as well as } (A_{\cdot,1}, \ldots, A_{\cdot,n}) \\ \left( \not \boxtimes \dim S_c = \dim \operatorname{span} \left( A_{\cdot,1}, \ldots, A_{\cdot,n} \right) = \dim \operatorname{span} \left( A_{1,\cdot}, \ldots, A_{n,\cdot} \right) = \dim S_r = n \right. \right) \\ \Leftrightarrow \left( A_{1,\cdot}, \ldots, A_{n,\cdot} \right) \text{ is a basis of } \mathbf{F}^{1,n}. \right.$$

Now we show that  $(\Delta)$  properly.

$$= 0 v_1 + \dots + 0 v_n = 0$$

$$\Rightarrow b_1 = \dots = b_n = 0.$$

Thus by (2.39), (b) holds.

Thus 
$$b_1 A_{1,1} + \dots + b_n A_{1,n} = \dots = b_1 A_{n,1} + \dots + b_n A_{n,n} = 0$$
.

Which is equivalent to

• Note For [3.60]: Suppose  $(v_1, ..., v_n)$  is a basis of V and  $(w_1, ..., w_m)$  is a basis of W.

Define 
$$E_{i,j} \in \mathcal{L}(V,W)$$
 by  $E_{i,j}(v_x) = \delta_{ix}w_j$ ;  $\delta_{ix} = \begin{cases} 0, & i \neq x \\ 1, & i = x \end{cases}$  Corollary:  $E_{l,k}E_{i,j} = \delta_{jl}E_{i,k}$ .

Denote 
$$\mathcal{M}(E_{i,j})$$
 by  $\mathcal{E}^{(j,i)}$ .  $(\mathcal{E}^{(j,i)})_{l,k} = \begin{cases} 0, & i \neq k \lor j \neq l \\ 1, & i = k \land j = l \end{cases}$ 

Because  $\mathcal{L}(V, W)$  and  $\mathbf{F}^{m,n}$  are iso. And  $T = \mathcal{M}^{-1}\mathcal{M}(T)$ ;  $E_{i,j} = \mathcal{M}^{-1}\mathcal{E}^{(j,i)}$ .

$$\text{Hence } \forall T \in \mathcal{L}(V,W), \ \exists \,!\, A_{i,j} \in \mathbf{F}(\,\forall i \in \{1,\ldots,m\}, j \in \{1,\ldots,n\}\,), \\ \mathcal{M}(T) = A \ = \begin{pmatrix} A_{1,1} & \cdots & A_{1,n} \\ \vdots & \ddots & \vdots \\ A_{m,1} & \cdots & A_{m,n} \end{pmatrix}.$$

$$\text{Thus } A = \begin{pmatrix} A_{1,1} \mathcal{E}^{(1,1)} + & \cdots & + A_{1,n} \mathcal{E}^{(1,n)} \\ + & \cdots & + \\ \vdots & \ddots & \vdots \\ + & \cdots & + \\ A_{m,1} \mathcal{E}^{(m,1)} + & \cdots & + A_{m,n} \mathcal{E}^{(m,n)} \end{pmatrix} \Longleftrightarrow \begin{pmatrix} A_{1,1} E_{1,1} + & \cdots & + A_{1,n} E_{n,1} \\ + & \cdots & + \\ \vdots & \ddots & \vdots \\ + & \cdots & + \\ A_{m,1} E_{1,m} + & \cdots & + A_{m,n} E_{n,m} \end{pmatrix} = T.$$

$$\therefore \mathcal{L}(V, W) = \operatorname{span}\left(\underbrace{\begin{bmatrix} E_{1,1}, & \cdots, E_{n,1}, \\ \vdots & \ddots & \vdots \\ E_{1,m}, & \cdots, E_{n,m} \end{bmatrix}}_{B}; \quad \mathbf{F}^{m,n} = \operatorname{span}\left(\underbrace{\begin{bmatrix} \mathcal{E}^{(1,1)}, & \cdots, \mathcal{E}^{(1,n)}, \\ \vdots & \ddots & \vdots \\ \mathcal{E}^{(m,1)}, & \cdots, \mathcal{E}^{(m,n)} \end{bmatrix}}_{B_{\mathcal{M}}}.$$

Hence by [2.42] and [3.61], we conclude that B is a basis of  $\mathcal{L}(V, W)$  and that  $B_{\mathcal{M}}$  is a basis of  $\mathbf{F}^{m,n}$ .

*Prove that*  $\exists \lambda \in \mathbb{F}$ ,  $S = \lambda I \iff ST = TS$  *for every*  $T \in \mathcal{L}(V)$ .

**SOLUTION**: Using the notation and result in (o).

Suppose  $S = \lambda I$ . Then  $ST = TS = \lambda T$  for every  $T \in \mathcal{L}(V)$ . Conversely, if S = 0, then we are done.

Suppose  $S \neq 0$ , ST = TS,  $\forall T \in \mathcal{L}(V)$ .

Let 
$$S = E_{1,1} + \dots + E_{m,m} \Rightarrow \mathcal{M}(S, (v_1, \dots, v_1)) = \mathcal{M}(I, (w_1, \dots, w_n), (v_1, \dots, v_n)).$$

Then  $\forall k \in \{m+1,...,n\}, 0 \neq SR_{k,1} = R_{k,1}S$ . Hence  $n = \dim V = \dim \operatorname{range} S = m$ .

Note that  $R_{i,j}S = SR_{i,j} \iff Q_{i,j} = G_{i,j}$ . Thus  $Q_{i,j}(w_i) = w_j = a_{i,i}v_j = G_{i,j}(a_{1,i}v_1 + \cdots + a_{n,i}v_n)$ . Where:

### **SOLUTION:**

Note that  $deg[(x^2 + x)p''(x) + 2xp'(x) + p(3)] = deg p$ .

Define  $T_n: \mathcal{P}_n(\mathbf{R}) \to \mathcal{P}_n(\mathbf{R})$  by  $T_n(p) = (x^2 + x)p''(x) + 2xp'(x) + p(3)$ . Then  $T_n \in \mathcal{L}\left(\mathcal{P}_n(\mathbf{R})\right)$ .

And note that  $T_n(p) = 0 \Rightarrow \deg(T_n p) = -\infty = \deg p \Rightarrow p = 0$ . Thus  $T_n$  is inv.

 $\forall q \in \mathcal{P}(\mathbf{R})$ , if q = 0, let m = 0; if  $q \neq 0$ , let  $m = \deg q$ , we have  $q \in \mathcal{P}_m(\mathbf{R})$ .

Hence  $\exists p \in \mathcal{P}_m(\mathbf{R}), q(x) = T_m(p) = (x^2 + x)p''(x) + 2xp'(x) + p(3)$  for all  $x \in \mathbf{R}$ .

**2** Suppose  $V_1, ..., V_m$  are vecsps such that  $V_1 \times \cdots \times V_m$  is finite-dim. Prove that every  $V_i$  is finite-dim.

**SOLUTION:** Denote  $V_1 \times \cdots \times V_m$  by U. Denote  $\{0\} \times \cdots \{0\} \times V_i \times \{0\} \cdots \times \{0\}$  by  $U_i$ .

Let  $(v_1, ..., v_M)$  be a basis of U. Note that  $\forall u_i \in V_i, \in U_i \subseteq U$ , for each i.

Define 
$$R_i \in \mathcal{L}(V_i, U)$$
 by  $R_i(u_i) = (0, ..., 0, u_i, 0, ..., 0)$ .  
Define  $S_i \in \mathcal{L}(U, V_i)$  by  $S_i(u_1, ..., u_i, ..., u_m) = u_i$   $\Rightarrow S_i|_{U_i} = R_i^{-1}|_{U_i}$ 

Thus  $U_i$  and  $V_i$  are iso. X  $U_i$  is a subsp of a finite-dim vecsp U.

**3** Give an example of a vecsp V and its two subsps  $U_1$ ,  $U_2$  such that  $U_1 \times U_2$  and  $U_1 + U_2$  are iso but  $U_1 + U_2$  is not a direct sum.

### SOLUTION:

NOTE that at least one of  $U_1$ ,  $U_2$  must be infinite-dim.

For if not,  $U_1 \times U_2$  is finite-dim and  $\dim(U_1 \times U_2) = \dim(U_1 + U_2) = \dim U_1 + \dim U_2$ .

And V must be infinite-dim. For if not, both  $U_1$  and  $U_2$  are finite-dim subsps.

Let 
$$V = \mathbf{F}^{\infty} = U_1, U_2 = \{(x, 0, \dots) \in \mathbf{F}^{\infty} : x \in \mathbf{F}\}.$$

$$\begin{array}{l} \text{Define } T \in \mathcal{L}(U_1 \times U_2, U_1 + U_2) \text{ by } T\left((x_1, x_2, \cdots), (x, 0, \cdots)\right) = (x, x_1, x_2, \cdots) \\ \text{Define } S \in \mathcal{L}(U_1 + U_2, U_1 \times U_2) \text{ by } S(x, x_1, x_2, \cdots) = \left((x_1, x_2, \cdots), (x, 0, \cdots)\right) \end{array} \right\} \Rightarrow S = T^{-1}.$$

**4** Suppose  $V_1, \ldots, V_m$  are vecsps.

Prove that  $\mathcal{L}(V_1 \times \cdots \times V_m, W)$  and  $\mathcal{L}(V_1, W) \times \cdots \times \mathcal{L}(V_m, W)$  are iso.

**SOLUTION:** Using the notations in Problem (2).

Note that  $T(u_1, ..., u_m) = T(u_1, 0, ..., 0) + ... + T(0, ..., u_m)$ .

Define 
$$\varphi: T \mapsto (T_1, \dots, T_m)$$
 by  $\varphi(T) = (TR_1, \dots, TR_m)$ .  
Define  $\psi: (T_1, \dots, T_m) \mapsto T$  by  $\psi(T_1, \dots, T_m) = T_1S_1 + \dots + T_mS_m$ .  $\Rightarrow \psi = \varphi^{-1}$ .

**5** Suppose  $W_1, ..., W_m$  are vecsps.

Prove that  $\mathcal{L}(V, W_1 \times \cdots \times W_m)$  and  $\mathcal{L}(V, W_1) \times \cdots \times \mathcal{L}(V, W_m)$  are iso.

**SOLUTION**: Using the notations in Problem (2).

Note that  $Tv = (w_1, ..., w_m)$ . Define  $T_i \in \mathcal{L}(V, W_i)$  by  $T_i(v) = w_i$ .

$$\begin{array}{l} \text{Define } \varphi: T \mapsto (T_1, \dots, T_m) \text{ by } \varphi(T) = (S_1 T, \dots, S_m T). \\ \text{Define } \psi: (T_1, \dots, T_m) \mapsto T \text{ by } \psi(T_1, \dots, T_m) = T_1 S_1 + \dots + T_m S_m. \end{array} \right\} \Rightarrow \psi = \varphi^{-1}.$$

**6** For  $m \in \mathbb{N}^+$ , define  $V^m$  by  $\underbrace{V \times \cdots \times V}_{m \text{ times}}$ . Prove that  $V^m$  and  $\mathcal{L}(\mathbf{F}^m, V)$  are iso.

#### **SOLUTION:**

Define  $T:(v_1,\ldots,v_m)\to \varphi$ , where  $\varphi:(a_1,\ldots,a_m)\mapsto v$  is defined by  $\varphi(a_1,\ldots,a_m)=a_1v_1+\cdots+a_mv_m$ .

- (a) Suppose  $T(v_1, \dots, v_m) = 0$ . Then  $\forall (a_1, \dots, a_n) \in \mathbf{F}^m, \varphi(a_1, \dots, a_m) = a_1v_1 + \dots + a_mv_m = 0$  $\Rightarrow (v_1, \dots, v_m) = 0 \Rightarrow T$  is inje.
- (b) Suppose  $\psi \in \mathcal{L}(\mathbf{F}^m, V)$ . Let  $(e_1, \dots, e_m)$  be the standard basis of  $\mathbf{F}^m$ . Then  $\forall (b_1, \dots, b_n) \in \mathbf{F}^m$ ,  $\left[ T\left( \psi(e_1), \dots, \psi(e_m) \right) \right] (b_1, \dots, b_m) = b_1 \psi(e_1) + \dots + b_m \psi(e_m) = \psi(b_1 e_1 + \dots + b_m e_m) = \psi(b_1, \dots, b_m).$  Thus  $T\left( \psi(e_1), \dots, \psi(e_m) \right) = \psi$ . Hence T is surj.  $\square$
- 7 Suppose  $v, x \in V$  (arbitrary) and U and W are subsps of V.

Suppose v + U = x + W. Prove that U = W.

### SOLUTION:

```
(a) \forall u \in U, \exists w \in W, v + u = x + w, let u = 0, now v = x + w \Rightarrow v - x \in W.
```

(b) 
$$\forall w \in W$$
,  $\exists u \in U, v + u = x + w$ , let  $w = 0$ , now  $x = v + u \Rightarrow x - v \in U$ .

Thus 
$$\pm (v - x) \in U \cap W \Rightarrow \begin{cases} u = (x - v) + w \in W \Rightarrow U \subseteq W \\ w = (v - x) + u \in U \Rightarrow W \subseteq U \end{cases} \Rightarrow U = W.$$

• Let  $U = \{(x, y, z) \in \mathbb{R}^3 : 2x + 3y + 5z = 0\}$ . Suppose  $A \subseteq \mathbb{R}^3$ . Prove that  $U = \{x \in V : Tx = c\}$  is either  $\emptyset$  or is a translate of null T.

### SOLUTION:

If  $c \in W$  but  $c \notin \text{range } T$ , then  $U = \emptyset$  and we are done.

Suppose  $c \in \text{range } T$ , then  $\exists u \in V, Tu = c \Rightarrow u \in U$ .

Suppose  $y \in \text{null } T \Rightarrow y + u \in U \iff T(y + u) = Ty + c = c$ .

Thus  $u + \text{null } T \subseteq U$ . Hence u + null T = U,

for if not, suppose  $z \notin u + \text{null } T \text{ but } Tz = c (\Leftrightarrow z \in U)$ ,

then  $\forall w \in \text{null } T, z \neq u + w \Leftrightarrow z - u \notin \text{null } T$ .

$$\not \subset \tilde{T}(z + \text{null } T) = \tilde{T}(u + \text{null } T) \Rightarrow z + \text{null } T = u + \text{null } T \Rightarrow z - u \in \text{null } T, \text{ contradicts.}$$

**COROLLARY:** The set of solutions to a system of linear equations such as [3.28] is either  $\emptyset$  or a translate of the null subsp.

**8** Suppose A is a nonempty subset of V.

Prove that A is a translate of some subsp of  $V \Longleftrightarrow \lambda v + (1-\lambda)w \in A$ ,  $\forall v,w \in A, \lambda \in F$ .

### **SOLUTION:**

Suppose A = a + U, where U is a subsp of V.  $\forall a + u_1, a + u_2 \in A, \lambda \in \mathbf{F}$ ,

$$\lambda(a + u_1) + (1 - \lambda)(a + u_2) = a + [\lambda(u_1 - u_2) + u_2] \in A.$$

Suppose  $\lambda v + (1 - \lambda)w \in A$ ,  $\forall v, w \in A$ ,  $\lambda \in F$ . Suppose  $a \in A$  and let  $A' = \{x - a : x \in A\}$ .

Then  $\forall x - a, y - a \in A', \lambda \in F$ ,

(I) 
$$\lambda(x-a) = [\lambda x + (1-\lambda)a] - a \in A'$$
. Then let  $\lambda = 2$ .

(II) 
$$\lambda(x-a) + (1-\lambda)(y-a) = \frac{1}{2}(x-a) + \frac{1}{2}(y-a) = \frac{1}{2}x + (1-\frac{1}{2})(y) - a \in A'$$
.  
By (I),  $2 \times \left[\frac{1}{2}(x-a) + \frac{1}{2}(y-a)\right] = (x-a) + (y-a) \in A'$ .

Thus 
$$A'$$
 is a subsp of  $V$ . Hence  $a + A' = \{(x - a) + a : x \in A\} = A$  is a translate.

**9** Suppose  $A_1 = v + U_1$  and  $A_2 = w + U_2$  for some  $v, w \in V$  and some subsps  $U_1, U_2$  of V. Prove that the intersection  $A_1 \cap A_2$  is either a translate of some subsp of V or is  $\emptyset$ .

### **SOLUTION:**

Suppose 
$$v + u_1, w + u_2 \in A_1 \cap A_2 \neq \emptyset$$
. By Problem (8),

$$\forall \lambda \in \mathbf{F}, \lambda(v + u_1) + (1 - \lambda)(w + u_2) \in A_1 \text{ and } A_2.$$
 Thus  $A_1 \cap A_2$  is a translate of some subsp of  $V$ .  $\square$ 

**10** Prove that the intersection of any collection of translates of subsps of V is either a translate of some subsp or  $\emptyset$ .

### **SOLUTION:**

Suppose  $\{A_{\alpha}\}_{\alpha\in\Gamma}$  is a collection of translates of subsps of V, where  $\Gamma$  is an arbitrary index set.

Suppose 
$$x, y \in \bigcap_{x \in \Gamma} A_x \neq \emptyset$$
, then by Problem (18),  $\forall \lambda \in \Gamma, \lambda x + (1 - \lambda)y \in A_x$  for every  $\alpha \in \Gamma$ .

Thus $\bigcap_{\alpha \in \Gamma} A_{\alpha}$ is a translate of some subsp of <i>V</i>	slate of some subsp of $V$ .	Thus $\bigcap_{\alpha \in \Gamma} A_{\alpha}$ is a

**11** Suppose 
$$A = \left\{ \lambda_1 v_1 + \dots + \lambda_m v_m : \sum_{i=1}^m \lambda_i = 1 \right\}$$
, where each  $v_i \in V, \lambda_i \in F$ .

- (a) Prove that  $\hat{A}$  is a translate of some subsp of V
- (b) Prove that if B is a translate of some subsp of V and  $\{v_1, \dots, v_m\} \subseteq B$ , then  $A \subseteq B$ .

(c) Prove that A is a translate of some subsp of V and dim V < m.

### SOLUTION:

(a) By Problem (8), 
$$\forall u, w \in A, \lambda \in \mathbf{F}, \exists a_i, b_i \mathbf{F}, \lambda u + (1 - \lambda)w = \left(\lambda \sum_{i=1}^m a_i + (1 - \lambda) \sum_{i=1}^m b_i\right)v_i \in A.$$

- (b) Let  $v = \lambda_1 v_+ \cdots + \lambda_m v_m \in A$ . To show that  $v \in B$ , use induction on m by k.

  - (ii)  $2 \le k \le m$ , we assume that  $v = \lambda_1 v_1 + \dots + \lambda_k v_k \in A \subseteq B$ .  $(\forall \lambda_i \text{ such that } \sum_{i=1}^k \lambda_i = 1)$  For  $u = \mu_1 v_1 + \dots + \mu_k v_k + \mu_{k+1} v_{k+1} \in A$ .  $\forall i = 1, \dots, k, \ \exists \ \mu_i \ne 1$ , fix one such i by i. Then  $\sum_{i=1}^{k+1} \mu_i \mu_i = 1 \mu_i \Rightarrow (\sum_{i=1}^{k+1} \frac{\mu_i}{1 \mu_i}) \frac{\mu_i}{1 \mu_i} = 1$ .

Let 
$$w = \underbrace{\frac{\mu_1}{1 - \mu_i} v_1 + \dots + \frac{\mu_{i-1}}{1 - \mu_i} v_{i-1} + \frac{\mu_{i+1}}{1 - \mu_i} v_{i+1} + \dots + \frac{\mu_{k+1}}{1 - \mu_i} v_{k+1}}_{k \text{ terms}}.$$

Let 
$$\lambda_i = \frac{\mu_i}{1 - \mu_i}$$
 for  $i = 1, \dots, i - 1$ ;  $\lambda_j = \frac{\mu_{j+1}}{1 - \mu_i}$  for  $j = i, \dots, k$ . Then,

$$\sum_{i=1}^{k} \lambda_i = 1 \Rightarrow w \in B$$

$$v_i \in B \Rightarrow u' = \lambda w + (1 - \lambda)v_i \in B$$

$$\Rightarrow \text{Let } \lambda = 1 - \mu_i. \text{ Thus } u' = u \in B \Rightarrow A \subseteq B.$$

(c) Fix a  $k \in \{1, ..., m\}$ . Given  $\lambda_i \in \mathbb{F}$  ( $i \in \{1, ..., m\} \setminus \{k\}$ ).

Let 
$$\lambda_k = 1 - \lambda_1 - \dots - \lambda_{k-1} - \lambda_{k+1} - \dots - \lambda_m$$

Then 
$$\lambda_1 v_1 + \dots + \lambda_k v_k + \dots + \lambda_m v_m = v_k + \sum_{i=1}^m \lambda_i (v_i - v_k)$$
.

Thus 
$$A = v_k + \text{span}(v_1 - v_k, \dots, v_{k-1} - v_k, v_{k+1} - v_k, \dots, v_m - v_k).$$

**12** Suppose U is a subsp of V such that V/U is finite-dim.

*Prove that is* V *is iso to*  $U \times (V/U)$ .

### **SOLUTION:**

Let  $(v_1 + U, ..., v_n + U)$  be a basis of V/U. Note that

$$\forall v \in V, \ \exists \ ! \ a_1, \dots, a_n \in F, v + U = \sum_{i=1}^n a_i(v_i + U) = (\sum_{i=1}^n a_i v_i) + U$$

$$\Rightarrow (v - a_1 v_1 - \dots - a_n v_n) = u \in U \text{ for some } u; v = \sum_{i=1}^n a_i v_i + u.$$

Thus define  $\varphi \in \mathcal{L}(V, U \times (V/U))$  by  $\varphi(v) = (u, \sum_{i=1}^{n} a_i v_i + U)$ 

and

Now we have:  $u[j+i] = (\sum_{r=1}^m a_r e_r)[j+i] = \sum_{r=1}^m a_r e_r[s \cdot m! + 1 + i] = a_{i_1} + \dots + a_{i_{\tau(i)}} = 0$ ,

$$\Rightarrow (\sum_{r=1}^{m} a_r e_r)[j+i] = a_{i_1} + \dots + a_{i_{\tau(i)}} = 0. \ (\Delta)$$

where  $i_1,\dots,i_{\tau(i)}$  are distinct ordered factors of i (  $1=i_1\leq\dots\leq i_{\tau(i)}=i$  ).

( Note that by definition,  $e_r[s \cdot m! + 1 + i] = 1 \iff s \cdot m! + i \equiv i \equiv 0 \pmod{r} \iff r \mid i$ .)

Let  $i' = i_{\tau(i)-1}$ . Notice that  $i'_l = i_l, \forall l \in \{1, ..., \tau(i')\}; \text{ and } \tau(i') = \tau(i) - 1$ .

Again by (

  Then \tilde{T} \in \mathcal{L}(V/\text{null }T,W) is defined as \tilde{T}(v+U) = Tv = w_v.
  Thus \tilde{T} is inje (by [3.91(b)]) and surj (range \tilde{T} = range T = W),

  (v_1, \ldots, v_m) is linely inde \iff (\varphi(v_1), \ldots, \varphi(v_m)) is linely inde.
```

(a) Suppose  $(v_1, ..., v_m)$  is linely inde and  $\vartheta \in \text{span } (\varphi(v_1), ..., \varphi(v_m))$ .

Let  $\vartheta = 0 = a_1 \varphi(v_1) + \dots + a_m \varphi(v_m)$ . Then  $\vartheta(1) = 0 = a_1 v_1 + \dots + a_m v_m \Rightarrow a_1 = \dots = a_m = 0$ .

Or. Because \varphi is inje. Suppose a_1\varphi(v_1) + \cdots + a_m\varphi(v_m) = 0 = \varphi(a_1v_1 + \cdots + a_mv_m).
          Then a_1v_1 + \cdots + a_mv_m = 0 \Rightarrow a_1 = \cdots = a_m = 0.
          Thus (\varphi(v_1), \dots, \varphi(v_m)) is linely inde.
    (b) Suppose (\varphi(v_1), ..., \varphi(v_m)) is linely inde and v \in \text{span}(v_1, ..., v_m).
          Let v = 0 = a_1 v_1 + \dots + a_m v_m. Then \varphi(v) = a_1 \varphi(v_1) + \dots + a_m \varphi(v_m) = 0 \Rightarrow a_1 = \dots = a_m = 0.
          Thus v_1, \ldots, v_m is linely inde.
                                                                                                                                                                         • Suppose T \in \mathcal{L}(V, W) and (w_1, ..., w_m) is a basis of range T.

```
(c) \{ \varphi \in V' : (\text{null } \varphi_1) \cap \cdots \cap (\text{null } \varphi_m) \subseteq \text{null } \varphi \}
SOLUTION: By Problem (17), (b) and (c) are equi. By Problem (26) and the corollary in Problem (23),
              \left( (\operatorname{null} \varphi_1) \cap \cdots \cap (\operatorname{null} \varphi_m) \right)^0 = (\operatorname{null} \varphi_1)^0 + \cdots + (\operatorname{null} \varphi_m)^0. 

\mathbb{Z} \operatorname{span}(\varphi_i) = \left\{ v \in V : \forall \psi \in \operatorname{span}(\varphi_i), \psi(v) = 0 \right\}^0 = (\operatorname{null} \varphi_i)^0.

COROLLARY: 30 Suppose V is finite-dim and \varphi_1, ..., \varphi_m is a linely inde list in V'.
                          Then dim ((\text{null } \varphi_1) \cap \cdots \cap (\text{null } \varphi_m)) = (\text{dim } V) - m.
6 Define \Gamma: V' \to \mathbf{F}^m by \Gamma(\varphi) = (\varphi(v_1), \dots, \varphi(v_m)), where v_1, \dots, v_m \in V.
   (a) Show that span (v_1, ..., v_m) = V \iff \Gamma is inje.
   (b) Show that (v_1, ..., v_m) is linely inde \iff \Gamma is surj.
SOLUTION:
             Suppose \Gamma is inje. Then let \Gamma(\varphi)=0, getting \varphi=0\Leftrightarrow \operatorname{null} \varphi=V=\operatorname{span}(v_1,\ldots,v_m).
             Suppose span (v_1, ..., v_m) = V. Then let \Gamma(\varphi) = 0, getting \varphi(v_i) = 0 for each i,
                                                                    null φ = span (v_1, ..., v_m) = V, thus φ = 0, Γ is inje.
             Suppose \Gamma is surj. Then let \Gamma(\varphi_i) = e_i for each i, where (e_1, \dots, e_m) is the standard basis of \mathbf{F}^m.
                    Then (\varphi_1, \dots, \varphi_m) is linely inde, suppose a_1v_1 + \dots + a_mv_m = 0,
   (b)
                    then for each i, we have \varphi_i(a_1v_1 + \cdots + a_mv_m) = a_i = 0. Thus v_1, \dots, v_n is linely inde.
             Suppose (v_1,\ldots,v_m) is linely inde. Let (\varphi_1,\ldots,\varphi_m) be the dual basis of span (v_1,\ldots,v_m).
                   Thus for each (a_1, \ldots, a_m) \in \mathbf{F}^m, we have \varphi = a_1 \varphi_1 + \cdots + a_m \varphi_m so that \Gamma(\varphi) = (a_1, \ldots, a_m). \square
• Define \Gamma: V \to \mathbf{F}^m by \Gamma(v) = (\varphi_1(v), \dots, \varphi_m(v)), where \varphi_1, \dots, \varphi_m \in V'.
  (c) Show that span (\varphi_1, ..., \varphi_m) = V' \iff \Gamma is inje.
  (d) Show that (\varphi_1, ..., \varphi_m) is linely inde \iff \Gamma is surj.
SOLUTION:
            Suppose \Gamma is inje. Then \Gamma(v)=0 \Leftrightarrow \forall i, \varphi_i(v)=0 \Leftrightarrow v \in (\operatorname{null} \varphi_1) \cap \cdots \cap (\operatorname{null} \varphi_m) \Leftrightarrow v=0.
                   Getting (\text{null } \varphi_1) \cap \cdots \cap (\text{null } \varphi_m) = \{0\}. By Problem (\bullet) above, span (\varphi_1, \dots, \varphi_m) = V'
   (c)
            Suppose span (\varphi_1, \dots, \varphi_m) = V'. Again by Problem (\bullet), (\text{null } \varphi_1) \cap \dots \cap (\text{null } \varphi_m) = \{0\}.
                   Thus \Gamma(v) = 0 \Rightarrow \forall i, \varphi_i(v) = 0 \Rightarrow v = 0.
             Suppose (\varphi_1, ..., \varphi_m) is linely inde. Then by Problem (31), (v_1, ..., v_m) is linely inde.
                   Thus for any (a_1, \dots, a_m) \in \mathbb{F}, by letting v = \sum_{i=1}^m a_i v_i, then \varphi_i(v) = a_i \Rightarrow \Gamma(v) = (a_1, \dots, a_m).
             Suppose \Gamma is surj. Let e_1, \dots, e_m be a basis of \mathbf{F}^m.
                   For every e_i, \exists v_i \in V such that \Gamma(v_i) = (\varphi_1(v_i), \dots, \varphi_m(v)) = e_i,
                   fix v_i (\Rightarrow (v_1,...,v_m) is linely inde). Thus \varphi_i(v_i) = 1, \varphi_i(v_i) = 0.
                   Hence (\varphi_1, \dots, \varphi_m) is the dual basis of the basis v_1, \dots, \varphi_m of span (v_1, \dots, v_m).

SOLUTION: By [3.111], T is linear. Note that (A^t)^t = A.
   (a) For any B \in \mathbb{F}^{n,m}, let A = B^t so that T(A) = B. Thus T is surj.
   (b) If T(A) = 0 for some A \in \mathbf{F}^{n,m}, then A = 0. Thus T is inje,
         for if not, \exists j, k \in \mathbb{N}^+ such that A_{i,k} \neq 0, then T(A)_{k,j} \neq 0, contradicts.
                                                                                                                                                       32 Suppose T \in \mathcal{L}(V), and (u_1, \dots, u_m), (v_1, \dots, v_m) are bases of V. Prove that

Then 
$$p(z) = p(z) - p(\lambda) = a_1(z - \lambda) + \dots + a_m(z^m - \lambda^m)$$
 for all  $z \in \mathbf{F}$ .

Hence

• **Note For [4.13]:** fundamental theorem of algebra, first version

With r, q as defined uniquely above, we are done.

Every nonconst poly with complex coefficients has a zero in C. Another Proof:

For any  $w \in C$ ,  $k \in \mathbb{N}^+$ , by polar coordinates,  $\exists r \ge 0, \theta \in \mathbb{R}$ ,  $r(\cos \theta + i \sin \theta) = w$ .

By De Moivre' theorem,  $w^k = [r(\cos\theta + i\sin\theta)]^k = r^k(\cos k\theta + i\sin k\theta)$ .

Hence  $\left(r^{1/k}(\cos\frac{\theta}{k}+i\sin\frac{\theta}{k})\right)^k=w$ . Thus every complex number has a  $k^{th}$  root.

Suppose a nonconst  $p \in \mathcal{P}(\mathbf{C})$  with highest-order nonzero term  $c_m z_m$ .

Then 
$$|p(z)| \to \infty$$
 as  $|z| \to \infty$  (because  $\frac{|p(z)|}{|z_m|} \to |c_m|$  as  $|z| \to \infty$ ).

Thus the continuous function  $z \to |p(z)|$  has a global minimum at some point  $\zeta \in \mathbb{C}$ .

To show that  $p(\zeta) = 0$ , assume  $p(\zeta) \neq 0$ . Define  $q \in \mathcal{P}(C)$  by  $q(z) = \frac{p(z + \zeta)}{p(\zeta)}$ .

The function  $z \to |q(z)|$  has a global minimum value of 1 at z = 0.

Write  $q(z) = 1 + a_k z^k + \dots + a_m z^m$ , where  $k \in \mathbb{N}^+$  is the smallest such that  $a_k \neq 0$ .

Let  $\beta \in \mathbb{C}$  be such that  $\beta^k = -\frac{1}{a_k}$ .

There is a const c > 1 so that if  $t \in (0,1)$ , then  $|q(t\beta)| \le |1 + a_k t^k \beta^k| + t^{k+1} c = 1 - t^k (1 - tc)$ .

Now letting t = 1/(2c), we get  $|q(t\beta)| < 1$ . Contradicts. Hence  $p(\zeta) = 0$ , as desired.

$$p \in \mathcal{P}(\mathbf{R})$$
, define  $Tp : \mathbf{R} \to \mathbf{R}$  by  $(Tp)(x) = \begin{cases} \frac{p(x) - p(3)}{x - 3} & \text{if } x \neq 3, \\ p'(3) & \text{if } x = 3 \end{cases}$  for all  $x \in \mathbf{R}$ .

Show that  $Tp \in \mathcal{P}(R)$  for all  $p \in \mathcal{P}(R)$  and that  $T : \mathcal{P}(R) \to \mathcal{P}(R)$  is a linear map.

**SOLUTION:** 

For 
$$x \neq 3$$
,  $T(x^n) = \frac{x^n - 3^n}{x - 3} = \sum_{i=1}^n 3^{i-1} x^{n-i}$ .

For 
$$x = 3$$
,  $T(x^n) = 3^{n-1} \cdot n$ . Note that if  $x = 3$ , then  $\sum_{i=1}^n 3^{i-1} x^{n-i} = \sum_{i=1}^n 3^{n-1} = 3^{n-1} \cdot n$ .

Hence for all  $x \in \mathbb{R}$  and for all  $n \in \mathbb{N}$ ,  $T(x^n) = \sum_{i=1}^n 3^{i-1} x^{n-i} \in \mathcal{P}(\mathbb{R})$ .

Because *T* is linear, we conclude that  $Tp \in \mathcal{P}(\mathbf{R})$  for all  $p \in \mathcal{P}(\mathbf{R})$ .

Now we show that *T* is linear:

$$\forall p, q \in \mathcal{P}(R), \lambda \in R, T(p + \lambda q)(x) = \begin{cases} \frac{(p + \lambda q)(x) - (p + \lambda q)(3)}{x - 3} & \text{if } x \neq 3, \\ (p + \lambda q)'(3) & \text{if } x = 3 \end{cases} \text{ for all } x \in R.$$
Notice that 
$$\begin{cases} (p + \lambda q)(x) - (p + \lambda q)(3) = (p(x) - p(3)) + (\lambda q(x) - \lambda q(3)) \\ (p + \lambda q)'(3) = p'(3) + \lambda q'(3). \end{cases}$$

Notice that 
$$\begin{cases} (p + \lambda q)(x) - (p + \lambda q)(3) = (p(x) - p(3)) + (\lambda q(x) - \lambda q(3)) \\ (p + \lambda q)'(3) = p'(3) + \lambda q'(3). \end{cases}$$

Thus 
$$T(p + \lambda q)(x) = (T(p) + \lambda T(q))(x)$$
 for all  $x \in \mathbb{R}$ .

**9** Suppose  $p \in \mathcal{P}(\mathbf{C})$ . Define  $q : \mathbf{C} \to \mathbf{C}$  by  $q(z) = p(z)p(\overline{z})$ . Prove that  $q \in \mathcal{P}(\mathbf{R})$ .

**SOLUTION:** 

$$p(z) = a_n z^n + \dots + a_1 z + a_0 \Rightarrow p(\overline{z}) = a_n \overline{\underline{z}}^n + \dots + a_1 \overline{z} + a_0 \Rightarrow \overline{p(\overline{z})} = \overline{a_n} z^n + \dots + \overline{a_1} z + \overline{a_0}.$$

Note that 
$$q(z) = p(z)\overline{p(\overline{z})} = \overline{p(\overline{z})}p(z) = p(\overline{z})\overline{p(\overline{z})} = \overline{q(\overline{z})}$$
.

Hence letting 
$$q(z) = c_m x^m + \dots + c_1 x + c_0 \implies \overline{c_k} = c_k, c_k \in \mathbb{R}$$
 for each  $k$ .

**10** Suppose  $m \in \mathbb{N}$  and  $p \in \mathcal{P}_m(\mathbb{C})$  such that  $p(x_k) \in \mathbb{R}$  for each  $x_k$ , where  $x_0, x_1, ..., x_m \in \mathbb{R}$  are distinct. Prove that  $p \in \mathcal{P}(\mathbb{R})$ .

**SOLUTION:** 

Let 
$$p(x_k) = y_k$$
 for each  $k$ . By Problem (5),  $\exists ! q \in \mathcal{P}_m(\mathbf{R})$  such that  $q(x_k) = y_k$ . Hence  $p = q$ .

OR. Using the Lagrange Interpolating Polynomial.

Define 
$$q(x) = \sum_{j=0}^{m} \frac{(x - x_0)(x - x_1) \cdots (x - x_{j-1})(x - x_{j+1}) \cdots (x - x_m)}{(x_j - x_0)(x_j - x_1) \cdots (x_j - x_{j-1})(x_j - x_{j+1}) \cdots (x_j - x_m)} p(x_j).$$

 $\mathbb{X}$  For each j,  $x_i$ ,  $p(x_i) \in \mathbb{R} \Rightarrow q \in \mathcal{P}_m(\mathbb{R}) \subseteq \mathcal{P}_m(\mathbb{C})$ .

Notice that  $q(x_k) = 1 \cdot p(x_k) \Rightarrow (q - p)(x_k) = 0$  for each  $k \in \{0, 1, ..., m\}$ .

Then (q-p) has (m+1) distinct zeros, while  $(q-p) \in \mathcal{P}_m(\mathbb{C})$ . Hence by [4.12],  $q-p=0 \Rightarrow p=q.\square$ 

- **11** Suppose  $p \in \mathcal{P}(\mathbf{F})$  with  $p \neq 0$ . Let  $U = \{pq : q \in \mathcal{P}(\mathbf{F})\}$ .
  - (a) Show that dim  $\mathcal{P}(\mathbf{F})/U = \deg p$ .
  - (b) Find a basis of  $\mathcal{P}(\mathbf{F})/U$ .

**SOLUTION:** 

*U* is a subsp of  $\mathcal{P}(\mathbf{F})$  because  $\forall f, g \in \mathcal{P}(\mathbf{F}), \lambda \in \mathbf{F}, pf + \lambda pg = p(f + \lambda g) \in U$ .

NOTE: Define  $P:\to \mathcal{P}(\mathbf{F})$  by  $(Pq)(x)=p\left(q(x)\right)=(p\circ q)(x)\ (\neq p(x)q(x)\ )$ . P is not linear.

(a) By [4.8],  $\forall f \in \mathcal{P}(\mathbf{F}), \exists ! q, r \in \mathcal{P}(\mathbf{F}), f = (p)q + (r); \deg r < \deg p$ .

Hence 
$$\forall f \in \mathcal{P}(\mathbf{F}), \exists ! pq \in U, r \in \mathcal{P}_{\text{deg}\, n-1}(\mathbf{F}), f = (pq) + (r); r \notin U.$$

Thus  $\mathcal{P}(\mathbf{F}) = U \oplus \mathcal{P}_{\deg p-1}(\mathbf{F})$ . Therefore  $\mathcal{P}(\mathbf{F})/U$  and  $\mathcal{P}_{\deg p-1}(\mathbf{F})$  are iso. ### SOLUTION:

Suppose  $\lambda$  is an eigval of ST with an eigvec v. Then  $T(STv) = \lambda Tv = TS(Tv)$ .

If Tv = 0 (while  $v \neq 0$ ), then T is not inje  $\Rightarrow (TS - 0I)$  and (ST - 0I) are not inje.

Thus  $\lambda = 0$  is an eigval of ST and TS with the same eigvec v.

Otherwise,  $Tv \neq 0$ , then  $\lambda$  is an eigval of TS. Reversing the roles of T and S.

*Prove that the set of eigvals of T equals the set of eigvals of A.* 

### SOLUTION:

(a) Suppose  $v_1, \dots, v_m$  are all linely inde eigers of T

with correspd eigvals  $\lambda_1, \dots, \lambda_m$  respectively (possibly with repetitions).

Extend to a basis of V as  $(v_1, \dots, v_m, \dots, v_n)$ .

Then for each  $k \in \{1, ..., m\}$ , span  $(v_k) \subseteq \text{null } (T - \lambda_k I)$ .

Define  $S_k \in \mathcal{L}(V)$  by  $S_k(v_i) = v_k$  for each  $j \in \{1, ..., n\}$ ,

so that range  $S_k = \text{span}(v_k)$  for each  $k \in \{1, ..., m\}$ , then  $\mathcal{A}(S_k) = TS_k = \lambda_k S_k$ .

Thus the eigvals of T are eigvals of A.

(b) Suppose  $\lambda_1, \dots, \lambda_m$  are all eigvals of  $\mathcal{A}$  with eigvecs  $S_1, \dots, S_m$  respectively.

Then for each  $k \in \{1, ..., m\}$ ,  $\exists v \in V, 0 \neq u = S_k(v) \in V \Rightarrow Tu = (TS_k)v = (\lambda_k S_k)v = \lambda_k u$ .

Thus the eigvals of  $\mathcal{A}$  are eigvals of T.

Or.

(a) Suppose  $\lambda$  is an eigval of T with an eigvec v.

Let  $v_1 = v$  and extend to a basis  $(v_1, ..., v_m)$  of V.

Then  $(T - \lambda I)Sv_1 = 0 = (T - \lambda I)Sv_k = 0$ .

Hence  $(T - \lambda I)S = 0 \Rightarrow TS = \lambda S$  while  $S \neq 0$ . Thus  $\lambda$  is also an eigval of  $\mathcal{A}$ .

(b) Suppose  $\lambda$  is an eigval of  $\mathcal{A}$  with an eigvec S. Then  $(T - \lambda I)S = 0$  while  $S \neq 0$ .

Notice that V might be  $\{0\}$ . In this case we are done. Suppose dim  $V \ge 1$ . We prove by contrapositive:

Suppose  $U \neq \{0\}$  and  $U \neq V$ . Prove that  $\exists T \in \mathcal{L}(V)$  such that U is not invar under T.

Let *W* be such that  $V = U \oplus W$ .

Let  $(u_1, ..., u_m)$  be a basis of U and  $(w_1, ..., w_n)$  be a basis of W.

Hence  $(u_1, \ldots, u_m, w_1, \ldots, w_n)$  is a basis of V.

Define 
$$T \in \mathcal{L}(V)$$

### **SOLUTION:**

(a) Suppose  $v \in V$  is an eigvec correspd to the eigval  $\lambda$ .

Then 
$$Tv = \lambda v \Rightarrow T_{\mathbf{C}}(v + \mathbf{i}0) = Tv + \mathbf{i}T0 = \lambda v$$
.

Thus  $\lambda$  is an eigval of T.

Suppose  $v + iu \in V_{\mathbf{C}}$  is an eigvec correspd to the eigval  $\lambda$ .

Then  $T_{\rm C}(v+{\rm i}u)=\lambda v+{\rm i}\lambda u\Rightarrow Tv=\lambda v$ ,  $Tu=\lambda u$ . (Note that v or u might be zero ).

Thus  $\lambda$  is an eigval of  $T_{\rm C}$ .

(b) Suppose  $\lambda$  is an eigval of  $T_{\rm C}$  with an eigvec  $v+{\rm i}u$ .

Let  $(v_1, ..., v_n)$  be a basis of V. Write  $v = \sum_{i=1}^n a_i v_i$ ,  $u = \sum_{i=1}^n b_i v_i$ , where  $a_i, b_i \in \mathbf{R}$ .

Then  $T_{\rm C}(v+{\rm i}u)=Tv+{\rm i}Tu=\lambda v+{\rm i}\lambda u=\lambda\sum_{i=1}^n(a_i+{\rm i}b_i)v_i$ . Conjugating two sides, we have:

$$\overline{T_{\mathrm{C}}(v+\mathrm{i}u)} = \overline{Tv+\mathrm{i}Tu} = \overline{Tv}-\mathrm{i}\overline{Tu} = Tv-\mathrm{i}Tu = T_{\mathrm{C}}(\overline{v+\mathrm{i}u}) = \overline{\lambda}\sum_{i=1}^{n}(a_i+\mathrm{i}b_i)v_i = \overline{\lambda}\sum_{i=1}^{n}(a_i-\mathrm{i}b_i)v_i.$$

Hence  $\overline{\lambda}$  is an eigval of  $T_{\mathbf{C}}$ . To prove the other direction, notice that  $\left(\overline{\lambda}\right)=\lambda.$ 

### • Suppose V is finite-dim, $T \in \mathcal{L}(V)$ , and $\lambda \in \mathbf{F}$ .

Show that  $\lambda$  is an eigeal of  $T \iff \lambda$  is an eigeal of the dual operator  $T' \in \mathcal{L}(V')$ .

### **SOLUTION:**

(a) Suppose  $\lambda$  is an eigval of T with an eigvec v.

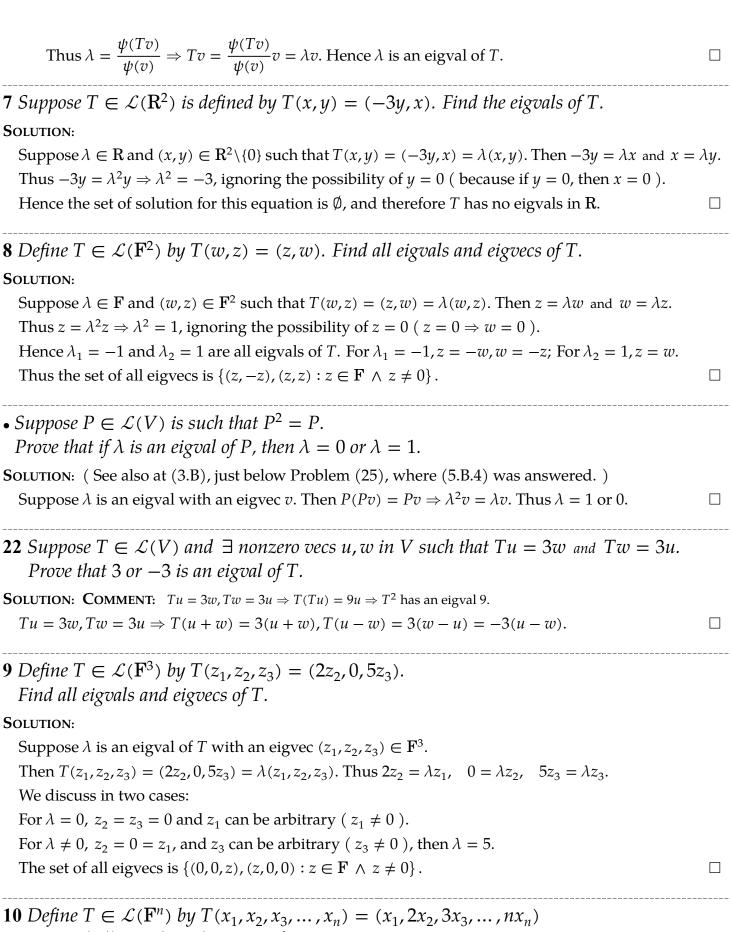

Then  $(T - \lambda I_V)$  is not inv.  $\not \subset V$  is finite-dim.

Thus by [3.108, 110], [3.101] and Problem (12) in (3.F),  $(T - \lambda I_V)' = T' - \lambda I_V$ , is not inv.

Hence  $\lambda$  is an eigval of T'.

(b) Suppose  $\lambda$  is an eigval T' with an eigvec  $\psi$ . Then  $T'(\psi) = \psi \circ T = \lambda \psi$ .

  - (a) Find all eigvals and eigvecs of T.
  - (b) Find all invar subsps of V under T.

### **SOLUTION:**

(a) Suppose  $v = (x_1, x_2, x_3, ..., x_n)$  is an eigvec of T with an eigval  $\lambda$ .

Then  $Tv = \lambda v = (x_1, 2x_2, 3x_3, ..., nx_n) = (\lambda x_1, \lambda x_2, \lambda x_3, ..., \lambda x_n)$ .

Hence  $1, \dots, n$  are eigvals of T.

And  $\{(0,\ldots,0,x_{\lambda},0,\ldots,0)\in \mathbf{F}^n:\lambda=1,\ldots,n,\ x_{\lambda}\in \mathbf{F}\land x_{\lambda}\neq 0\}$  is the set of all eigences of T.

(b) Let  $V_{\lambda} = \{(0, \dots, 0, x_{\lambda}, 0, \dots, 0) \in \mathbf{F}^n : x_{\lambda} \in \mathbf{F} \land x_{\lambda} \neq 0\}$ . Then  $V_1, \dots, V_n$  are invar under T.

Hence by Problem (4), every sum of $V_1, \dots, V_n$ is a invar subsp of $V$ under $T$ .	
<b>11</b> Define $T : \mathcal{P}(\mathbf{R}) \to \mathcal{P}(\mathbf{R})$ by $Tp = p'$ . Find all eigenstand eigenstands of $T$ .	
SOLUTION:	
Note that in general, $\deg p' < \deg p$ ( $\deg 0 = -\infty$ ).	
Suppose $\lambda$ is an eigval of $T$ with an eigvec $p$ .	
Suppose $\lambda \neq 0$ . Then $\deg \lambda p > \deg p'$ while $\lambda p \neq p'$ . Contradicts. Thus $\lambda = 0$ .	
Therefore $\deg \lambda p = -\infty = \deg p \Rightarrow p$ is a nonzero const poly.	
Hence the set of all eigvecs is $\{C: C \in \mathbb{R} \land C \neq 0\} = \mathcal{P}_0(\mathbb{R}) \setminus \{0\}.$

SOLUTION:	
Suppose $\lambda$ is an eigval of $T$ with an eigvec $p$ , then $(Tp)(x) = xp'(x) = \lambda p(x)$ .	
Let $p = a_0 + a_1 x + \dots + a_n x^n$ .	
Then $xp'(x) = a_1x + 2a_2x^2 + \dots + na_nx^n = \lambda a_0 + \lambda a_1x + \lambda a_2x^2 + \dots + \lambda a_nx^n$ .

Solution:	
Suppose $\lambda$ is an eigval of $P$ with an eigvec $(u+w)$ .	
Then $P(u+w) = u = \lambda u + \lambda w \Rightarrow (\lambda - 1)u + \lambda w = 0$ . By [1.44] and $V = U \oplus W$ , $(\lambda - 1)u = \lambda v$	v=0.
Thus if $\lambda = 1$ , then $w = 0$ ; if $\lambda = 0$ , then $u = 0$ .	_
Hence the eigvals of $P$ are 0 and 1, the set of all eigvecs in $P$ is $U \cup W$ .

Suppose  $\lambda$  is an eigval of T with an eigvec (x, y, z, w).

Then 
$$T(x, y, z, w) = \lambda(x, y, z, w) \Rightarrow \begin{cases} (1 - \lambda)x + y + z + w = 0 \\ -x + (1 - \lambda)y - z - w = 0 \\ 3x + 8y + (11 - \lambda)z + 5w = 0 \\ 3x - 8y - 11z + (5 - \lambda)w = 0 \end{cases}$$

This linear equation has no solutions.

( You can type it on https://zh.numberempire.com/equationsolver.php to check.)

Or. Define 
$$T \in \mathcal{L}(\mathbf{R}^4)$$
 by  $T(x_1, x_2, x_3, x_4) = (-x_2, x_1, -x_4, x_3)$ .

Suppose  $\lambda$  is an eigval of T with an eigvec (x, y, z, w).

Then 
$$T(x, y, z, w) = (\lambda x, \lambda y, \lambda z, \lambda w) = (-y, x, -w, z) \Rightarrow \begin{cases} -y = \lambda x \\ x = \lambda y \\ -w = \lambda z \end{cases} \Rightarrow \begin{cases} -xy = \lambda^2 xy \\ -zw = \lambda^2 zw \end{cases}$$

If  $xy \neq 0$  or  $zw \neq 0$ , then  $\lambda^2 = -1$ , we fail.

Otherwise,  $xy = 0 \Rightarrow x = y = 0$ , for if  $x \neq 0$ , then  $\lambda = 0 \Rightarrow x = 0$ , contradicts.

Similarly, y = z = w = 0. Then we fail. Thus *T* has no eigvals.

• Suppose  $(v_1, ..., v_n)$  is a basis of V and  $T \in \mathcal{L}(V)$ ,  $\mathcal{M}(T, (v_1, ..., v_n)) = A$ . Prove that if  $\lambda$  is an eigeal of T, then  $|\lambda| \le n \max\{|A_{j,k}| : 1 \le j, k \le n\}$ .

### **SOLUTION:**

First we show that  $|\lambda| = n \max \{|A_{j,k}| : 1 \le j, k \le n\}$  for some cases.

Consider 
$$A = \begin{pmatrix} k & \cdots & k \\ \vdots & \ddots & \vdots \\ k & \cdots & k \end{pmatrix}$$
. Then  $nk$  is an eigval of  $T$  with an eigvec  $v_1 + \cdots + v_n$ . Now we show that if  $|\lambda| \neq n \max\left\{\left|A_{j,k}\right| : 1 \leq j, k \leq n\right\}$ , then  $|\lambda| < n \max\left\{\left|A_{j,k}\right| : 1 \leq j, k \leq n\right\}$ .

### **SOLUTION:**

Suppose  $\lambda$  is an eigval of T with an eigvec  $(z_1, z_2, ...)$ .

Then 
$$T(z_1, z_2, \dots) = (\lambda z_1, \lambda z_2, \dots) = (0, z_1, z_2, \dots).$$

Thus 
$$\lambda z_1 = 0$$
,  $\lambda z_2 = z_1, \dots, \lambda z_k = z_{k-1}, \dots$ .

Let  $\lambda = 0$ , then  $\lambda z_2 = z_1 = 0 = \lambda z_k = z_{k-1}$ , therefore  $(z_1, z_2, \dots) = 0$  is not an eigvec.

Suppose  $\lambda \neq 0$ . Then  $\lambda z_1 = 0 \Rightarrow z_1 = 0 \Rightarrow z_2 = 0 = z_k$  for all  $k \in \mathbb{N}^+$ .

And then  $(z_1, z_2, ...) = 0$  is not an eigvec. Hence T has no eigvals.

### **19** Suppose $n \in \mathbb{N}^+$ . Define $T \in \mathcal{L}(\mathbb{F}^n)$ by

$$T(x_1, \dots, x_n) = (x_1 + \dots + x_n, \dots, x_1 + \dots + x_n).$$

In other words, the entries of  $\mathcal{M}(T)$  with resp to the standard basis are all 1's.

Find all eigvals and eigvecs of T.

### **SOLUTION:**

Suppose  $\lambda$  is an eigval of T with an eigvec  $(x_1, \dots, x_n)$ .

Then 
$$T(x_1,...,x_n) = (\lambda x_1,...,\lambda x_n) = (x_1 + \cdots + x_n,...,x_1 + \cdots + x_n).$$

Thus 
$$\lambda x_1 = \dots = \lambda x_n = x_1 + \dots + x_n$$
.

For 
$$\lambda = 0$$
,  $x_1 + \dots + x_n = 0$ .

For 
$$\lambda \neq 0$$
,  $x_1 = \cdots = x_n$  and then  $\lambda x_k = nx_k$  for each  $k$ .

Hence 0, n are eigvecs of T.

And the set of all eigences of

- (b) Find all eigvecs of S.

### SOLUTION:

Suppose  $\lambda$  is an eigval of S with an eigvec  $(z_1, z_2, ...)$ .

Then 
$$S(z_1, z_2, z_3 \dots) = (\lambda z_1, \lambda z_2, \dots) = (z_2, z_3, \dots).$$

Thus 
$$\lambda z_1 = z_2, \lambda z_2 = z_3, ..., \lambda z_k = z_{k+1}, ...$$

For 
$$\lambda = 0$$
,  $\lambda z_1 = z_2 = 0 = \lambda z_2 = z_3 = \dots = z_k$  for all  $k$ .

While  $z_1$  can be arbitrary, so that  $(z_1, 0, ...)$  is an eigeec with  $z_1 \neq 0$ .

For 
$$\lambda \neq 0$$
,  $\lambda^k z_1 = \lambda^{k-1} z_2 = \dots = \lambda z_k = z_{k+1}$  for all  $k$ .

Then 
$$(z_1, \lambda z_1, \lambda^2 z_1, \dots, \lambda^k z_1, \dots)$$
 is an eigvec with  $z_1 \neq 0$ .

Hence (a) each element of  $\lambda \in \mathbf{F}$  is an eigval of T.

And (b) the set of all eigvecs of 
$$T$$
 is  $\{(z_1, \lambda z_1, \lambda^2 z_1, \dots, \lambda^k z_1, \dots) \in \mathbb{F}^{\infty} : \lambda \in \mathbb{F}, z_1 \neq 0\}$

Suppose  $T \in \mathcal{L}(V)$  is such that every subsp of V of dim k is invar under T.

*Prove that T is a scalar multi of the identity operator.* 

### **S**OLUTION: We prove the contrapositive:

Suppose T is not a scalar multi of I. Prove that  $\exists$  an invar subsp U of V under T such that dim U = k.

By Problem (26),  $\exists v \in V$  and  $v \neq 0$  such that v is not an eigvec of T.

Thus (v, Tv) is linely inde. Extend to a basis of V as  $(v, Tv, u_1, \dots, u_n)$ .

Let  $U = \operatorname{span}(v, u_1, \dots, u_{k-1}) \Rightarrow U$  is not an invar subsp of V under T.

Or. Suppose  $0 \neq v = v_1 \in V$  and extend to a basis of V as  $(v_1, \dots, v_n)$ .

where  $\alpha_j \in \{2, ..., n\}$  for each j, and  $\alpha_1, ..., \alpha_{k-1}$  are distinct.

Because every subsp such U is invar.

Thus 
$$Tv_1 = c_1v_1 + \dots + c_nv_n \in U \Rightarrow c_2 = \dots = c_n = 0$$
,

for if not, for each  $c_i \neq 0$ , choose  $U_i$  such that  $\alpha_j \in \{2, \dots, i-1, i+1, \dots, n\}$  for each j,

hence for  $Tv_1 = c_1v_1 + \dots + c_{i-1}v_{i-1} + c_{i+1}v_{i+1} + \dots + c_nv_n \in U_i$ , we conclude that  $c_i = 0$ .

*T* has an eigval  $\iff \exists$  an invar subsp *U* of *V* under *T* such that dim  $U = \dim V - 1$ .

### SOLUTION:

(a) Suppose  $\lambda$  is an eigval of T with an eigvec v.

( If dim 
$$V = 1$$
, then  $U = \{0\}$  and we are done. )

Extend  $v_1 = v$  to a basis of V as  $(v_1, v_2 ..., v_n)$ .

Step 1 If  $\exists w_1 \in \text{span}(v_2, ..., v_n)$  such that  $0 \neq Tw_1 \in \text{span}(v_1)$ ,

then extend  $w_1 = \alpha_{1,1}$  to a basis of span  $(v_2, \dots, v_n)$  as  $(\alpha_{1,1}, \dots, \alpha_{1,n-1})$ .

```
Otherwise, we stop at step 1.
       Step k If \exists w_k \in \text{span}(\alpha_{k-1,2},...,\alpha_{k-1,n-k+1}) such that 0 \neq Tw_k \in \text{span}(v_1, w_1,...,w_{k-1}),

        Let (u_1, ..., u_m) be a basis of U, extend to a basis of V as (u_0, u_1, ..., u_m).
        We discuss in cases:
        For Tu_0 \in U, then range T = U so that T is not surj \iff null T \neq \{0\} \iff 0 is an eigval of T.
        For Tu_0 \notin U, then Tu_0 = a_0u_0 + a_1u_1 + \cdots + a_mu_m.
        (1) If Tu_0 \in \text{span}(u_0), then we are done.
        (2) Otherwise, if range T|_U = U, then Tu_0 = a_0u_0 and we are done;
                          otherwise, T|_U: U \to U is not surj (\Rightarrow not inje), suppose range T|_U \neq \{0\}
                          (Suppose range T|_{U} = \{0\}. If dim U = 0 then we are done.
                                                        Otherwise \exists u \in U \setminus \{0\}, Tu = 0 and we are done.
                          then \exists u \in U \setminus \{0\}, Tu = 0, we are done.
                                                                                                                                    29 Suppose T \in \mathcal{L}(V) and range T is finite-dim.
    Prove that T has at most 1 + \dim \operatorname{range} T distinct eigvals.
SOLUTION:
   Let \lambda_1, \dots, \lambda_m be the distinct eigends of T and let v_1, \dots, v_m be the corresponding eigens.
   (Because range T is finite-dim. Let (v_1, \dots, v_n) be a list of all the linely inde eigvecs of T,
     so that the correspd eigvals are finite. )
  For every \lambda_k \neq 0, T(\frac{1}{\lambda_k}v_k) = v_k. And if T = T - 0I is not inje, then \exists ! \lambda_A = 0 and Tv_A = \lambda_A v_A = 0.
  Thus for \lambda_k \neq 0, \forall k, (Tv_1, \dots, Tv_m) is a linely inde list of length m in range T.
   And for \lambda_A = 0, there is a linely inde list of length at most (m-1) in range T.
   Hence, by [2.23], m \le \dim \operatorname{range} T + 1.
                                                                                                                                    32 Suppose that \lambda_1, \ldots, \lambda_n are distinct real numbers.
    Prove that (e^{\lambda_1}x, \dots, e^{\lambda_n}x) is linely inde in \mathbb{R}^{\mathbb{R}}.
    HINT: Let V = \text{span}(e^{\lambda_1}x, \dots, e^{\lambda_n}x), and define an operator D \in \mathcal{L}(V) by Df = f'.
    Find eigvals and eigvecs of D.
```

**SOLUTION:** 

Define *V* and  $D \in \mathcal{L}(V)$  as in HINT. Then because for each k,  $D(e^{\lambda_k x}) = \lambda_k e^{\lambda_k x}$ .

Thus  $\lambda_1, \dots, \lambda_n$  are distinct eigvals of D. By [5.10],  $(e^{\lambda_1}x, \dots, e^{\lambda_n}x)$  is linely inde in  $\mathbb{R}^{\mathbb{R}}$ .

• Suppose  $\lambda_1, \ldots, \lambda_n$  are distinct positive numbers. Prove that  $(\cos(\lambda_1 x), \ldots, \cos(\lambda_n x))$  is linely inde in  $\mathbb{R}^R$ .

### **SOLUTION:**

Let  $V = \text{span}\left(\cos(\lambda_1 x), \dots, \cos(\lambda_n x)\right)$ . Define  $D \in \mathcal{L}(V)$  by Df = f'.

Then because  $D(\cos(\lambda_k x)) = -\lambda_k \sin(\lambda_k x)$ .  $X D(\sin(\lambda_k x)) = \lambda_k \cos(\lambda_k x)$ .

Thus  $D^2(\cos(\lambda_k x)) = -\lambda_k^2 \cos(\lambda_k x)$ .

Notice that  $\lambda_1, \dots, \lambda_n$  are distinct  $\Rightarrow -\lambda_1^2, \dots, -\lambda_n^2$  are distinct.

Hence  $-\lambda_1^2, \dots, -\lambda_n^2$  are distinct eigens of  $D^2$ 

with the correspd eigvecs  $\cos(\lambda_1 x), \dots, \cos(\lambda_n x)$  respectively.

And then  $(\cos(\lambda_1 x), \dots, \cos(\lambda_n x))$  is linely inde in  $\mathbb{R}^{\mathbb{R}}$ .

• Suppose V is finite-dim,  $T \in \mathcal{L}(V)$ , and U is a subsp of V invar under T. The quotient operator  $T/U \in \mathcal{L}(V/U)$  is defined by

$$(T/U)(v+U) = Tv + U$$
 for each  $v \in V$ .

- (a) Show that the definition of T/U makes sense (which requires using the condition that U is invar under T) and show that T/U is an operator on V/U.
- (b) (OR Problem 35) Show that each eigral of T/U is an eigral of T.

### **SOLUTION:**

(a) Suppose v + U = w + U ( $\iff v - w \in U$ ).

Then because *U* is invar under T,  $T(v-w) \in U \iff Tv+U=Tw+U$ .

Hence the definition of T/U makes sense.

Now we show that T/U is linear.

$$\forall v + U, w + U \in V/U, \lambda \in \mathbf{F}, (T/U) \left( (v + U) + \lambda(w + U) \right)$$

$$= T(v + \lambda w) + U = (Tv + U) + \lambda(Tw + U)$$

$$= (T/U)(v + U) + \lambda(T/U)(w).$$

(b) Suppose  $\lambda$  is an eigval of T/U with an eigvec v + U.

Then 
$$(T/U)(v+U) = \lambda(v+U) = Tv + U = \lambda v + U \Rightarrow (T-\lambda I)v \in U$$
.

If 
$$(T - \lambda I)v = 0 \Rightarrow Tv = \lambda v$$
, then we are done.

Otherwise, then  $(T|_U - \lambda I) : U \to U$  is inv,

hence 
$$\exists ! w \in U, (T|_U - \lambda I)(w) = (T - \lambda I)v \Rightarrow T(v - w) = \lambda(v - w).$$

Note that  $v - w \neq 0$  ( for if not,  $v \in U \Rightarrow v + U = 0 + U$  is not an eigvec ).

### **36** Prove or give a counterexample:

The result of (b) in Exercise 35 is still true if V is infinite-dim.

**SOLUTION**: A counterexample:

Consider  $V = \text{span}(1, e^x, e^{2x}, \dots)$  in  $\mathbb{R}^{\mathbb{R}}$ , and a subsp  $U = \text{span}(e^x, e^{2x}, \dots)$  of V.

Define  $T \in \mathcal{L}(V)$  by  $Tf = e^x f$ . Then range T = U is invar under T.

Consider  $(T/U)(1 + U) = e^x + U = 0$ 

 $\Rightarrow$  0 is an eigval of T/U but is not an eigval of T

(null  $T = \{0\}$ , for if not,  $\exists f \in V \setminus \{0\}$ ,  $(Tf)(x) = e^x f(x) = 0$ ,  $\forall x \in \mathbb{R} \Rightarrow f = 0$ , contradicts ).

### **SOLUTION:**

```
\forall v + \text{range } T \in V/\text{range } T, v + \text{range } T \in \text{null } (T/(\text{range } T))
\Rightarrow null (T/(\text{range }T)) = V/\text{range }T \Rightarrow T/(\text{range }T) is a zero map.
```

**34** Suppose  $T \in \mathcal{L}(V)$ . Prove that T/(null T) is inje  $\iff$   $(\text{null } T) \cap (\text{range } T) = \{0\}$ .

### **SOLUTION:**

(a) Suppose T/(null T) is inje.

Then  $(T/(\operatorname{null} T))(u + \operatorname{null} T) = Tu + \operatorname{null} T = 0$ 

 $\Leftrightarrow Tu \in \text{null } T \not \subset Tu \in \text{range } T \Leftrightarrow u + \text{null } T = 0 \Leftrightarrow u \in \text{null } T \Leftrightarrow Tu = 0.$ 

Thus  $(\text{null } T) \cap (\text{range } T) = \{0\}.$ 

(b) Suppose (null T)  $\cap$  (range T) = {0}.

Then  $(T/(\operatorname{null} T))(u + \operatorname{null} T) = Tu + \operatorname{null} T = 0$ 

 $\Leftrightarrow Tu \in \text{null } T \not \subset Tu \in \text{range } T \Leftrightarrow Tu = 0 \Leftrightarrow u \in \text{null } T \Leftrightarrow u + \text{null } T = 0.$ 

Thus T/(null T) is inje.

Prove that  $\exists ! p_k \in M_T^0$ ,  $\deg p_k = \min\{\deg p_j\}_{j \in \Gamma} \leq \dim V$ .

**SOLUTION:** OR. Another Proof:

[ Existns Part ] We use induction on dim V.

- (i) If dim V = 0, then  $I = 0 \in \mathcal{L}(V)$  and let p = 1, we are done.
- (ii) Suppose dim  $V \ge 1$ .

Assume that dim V > 0 and that the desired result is true for all operators on all vecsps of smaller dim.

Let  $u \in V$ ,  $u \neq 0$ . The list  $(u, Tu, ..., T^{\dim V}u)$  of length  $(1 + \dim V)$  is linely depe.

Then  $\exists ! T^m$  of smallest degree such that  $T^m u \in \text{span}(u, Tu, ..., T^{m-1}u)$ .

Thus  $\exists c_i \in \mathbf{F}, c_0 u + c_1 T u + \dots + c_{m-1} T^{m-1} u + T^m u = 0.$ 

Define q by  $q(z) = c_0 + c_1 z + \dots + c_{m-1} z^{m-1} + z^m$ .

Then  $0 = T^k(q(T)u) = q(T)(T^ku), \forall k \in \{1, ..., m-1\} \subseteq \mathbb{N}.$ 

Because  $(u, Tu, ..., T^{m-1}u)$  is linely inde.

Thus dim null  $q(T) \ge m \Rightarrow \dim \operatorname{range} q(T) = \dim V - \dim \operatorname{null} q(T) \le \dim V - m$ .

Let W = range q(T).

By assumption,  $\exists s \in M_T^0$  of smallest degree (and deg  $s \leq \dim W$ , ) so that  $s(T|_W) = 0$ .

<b>COMMENT:</b> By NOTE FOR[8.40], $j$ has an upper bound $m-1$ , $m$ has an upper bound dim $V$ .	
Write $p(z) = a_0 + a_1 z + \dots + z^m$ ( $m \le \dim V$ ). If $v = 0$ , then we are done. Suppose $v \ne 0$ . (a) Suppose $j \in \mathbb{N}^+$ is the smallest such that $T^j v \in \operatorname{span}(v, Tv, \dots, T^{j-1}v) = U_0$ . Then $j \le m$ . Write $T^j v = c_0 v + c_1 Tv + \dots + c_{j-1} T^{j-1}v$ . And because $T(T^k v) = T^{k+1} \in U_0$ . $U_0$ is invar under the problem $f(x) = 0$ .	der T.
By Problem (6), $\forall k \in \mathbb{N}$ , $T^{j+k}v = T^k(T^jv) \in U_0$ . Thus $U_0 = \operatorname{span}(v, Tv, \dots, T^{j-1}v, \dots, T^nv)$ for all $n \ge j-1$ . Let $n = m-1$ and we are done.	

(b) Let  $U = \text{span}(v, Tv, ..., T^{m-1}v)$ .

*Prove that the mini poly p has degree at most*  $1 + \dim \operatorname{range} T$ .

If dim range  $T < \dim V - 1$ , then this result gives a better upper bound for the degree of mini poly.

### **SOLUTION:**

If *T* is inje, then range T = V and we are done. Now choose  $0 \neq v \in \text{null } T$ , then  $Tv + 0 \cdot v = 0$ .

1 is the smallest positive integer such that  $T^1v \in \text{span}(v, ..., T^0v)$ . Define q by  $q(z) = z \Rightarrow q(T)v = 0$ .

Let  $W = \operatorname{range} q(T) = \operatorname{range} T$ .  $\exists \operatorname{monic} s \in \mathcal{P}(\mathbf{F})$  of smallest degree  $(\operatorname{deg} s \leq \operatorname{dim} W)$ ,  $s(T|_W) = 0$ .

Hence sq is the mini poly (see Note For[8.40]) and  $deg(sq) = deg s + deg q \le dim \, range T + 1$ .  $\Box$ 

**19** Suppose V is finite-dim and  $T \in \mathcal{L}(V)$ . Let  $\mathcal{E} = \{q(T) : q \in \mathcal{P}(\mathbf{F})\}$ . Prove that dim  $\mathcal{E}$  equals the degree of the mini poly of T.

### SOLUTION:

Because the list  $(I, T, ..., T^{(\dim V)^2})$  of length dim  $\mathcal{L}(V) + 1$  is linely depe in dim  $\mathcal{L}(V)$ .

Suppose  $m \in \mathbb{N}^+$  is the smallest such that  $T^m = a_0 I + \cdots + a_{m-1} T^{m-1}$ .

Then *q* defined by  $q(z) = z^m - a_{m-1}z^{m-1} - \cdots - a_0$  is the mini poly (see [8.40]).

For any  $k \in \mathbb{N}^+$ ,  $T^{m+k} = T^k(T^m) \in \text{span}(I, T, ..., T^{m-1}) = U$ .

Hence span  $(I, T, ..., T^{(\dim V)^2}) = \text{span}(I, T, ..., T^{(\dim V)^2 - 1}) = U.$ 

Note that by the minimality of m, the list  $(I, T, ..., T^{m-1})$  is linely inde.

Thus dim  $U = m = \dim \operatorname{span}(I, T, \dots, T^{(\dim V)^2 - 1}) = \dim \operatorname{span}(I, T, \dots, T^n)$  for all  $m < n \in \mathbb{N}^+$ .

Define  $\varphi \in \mathcal{L}(\mathcal{P}_{m-1}(\mathbf{F}), \mathcal{E})$  by  $\varphi(p) = p(T)$ .

- (a) Suppose p(T) = 0.  $\forall \deg p \leq m 1 \Rightarrow p = 0$ . Then  $\varphi$  is inje.
- (b)  $\forall S = a_0 I + a_1 T + \dots + a_{m-1} T^{m-1} \in \mathcal{E}$ , define  $p \in \mathcal{P}_{m-1}(\mathbf{F})$  by  $p(z) = a_0 + a_1 z + \dots + a_{m-1} z^{m-1} \Rightarrow \varphi(p) = S$ . Then  $\varphi$  is surj.

Hence  $\mathcal{E}$  and  $\mathcal{P}_{m-1}(\mathbf{F})$  are iso.  $\mathbb{X}$  dim  $\mathcal{P}_{m-1}(\mathbf{F}) = m = \dim U$ .

• (4E 5.B.13) Suppose  $T \in \mathcal{L}(V)$  and  $q \in \mathcal{P}(\mathbf{F})$  is defined by

$$q(z) = a_0 + a_1 z + \dots + a_n z^n$$
, where  $a_n \neq 0$ , for all  $z \in \mathbf{F}$ .

Denote the mini poly of T by p defined by

$$p(z) = c_0 + c_1 z + \dots + c_{m-1} z^{m-1} + z^m \text{ for all } z \in \mathbf{F}.$$

*Prove that*  $\exists ! r \in \mathcal{P}(\mathbf{F})$  *such that* q(T) = r(T),  $\deg r < \deg p$ .

### **SOLUTION:**

If  $\deg q < \deg p$ , then we are done.

If  $\deg q = \deg p$ , notice that  $p(T) = 0 = c_0 I + c_1 T + \dots + c_{m-1} T^{m-1} + T^m$ 

$$\Rightarrow T^m = -c_0 I - c_1 T - \dots - c_{m-1} T^{m-1},$$

define 
$$r$$
 by  $r(z) = q(z) + [-a_m z^m + a_m (-c_0 - c_1 z - \dots - c_{m-1} z^{m-1})]$   
=  $(a_0 - a_m c_0) + (a_1 - a_m c_1)z + \dots + (a_{m-1} - a_m c_{m-1})z^{m-1}$ ,

hence r(T) = 0, deg r < m and we are done.

Now suppose  $\deg q \ge \deg p$ . We use induction on  $\deg q$ .

- (i)  $\deg q = \deg p$ , then the desired result is true, as shown above.
- (ii)  $\deg q > \deg p$ , assume that the desired result is true for  $\deg q = n$ .

Suppose 
$$f \in \mathcal{P}(\mathbf{F})$$
 such that  $f(z) = b_0 + b_1 z + \dots + b_n z^n + b_{n+1} z^{n+1}$ .

Apply the assumption to g defined by  $g(z) = b_0 + b_1 z + \dots + b_n z^n$ , getting *s* defined by  $s(z) = d_0 + d_1 z + \cdots + d_{m-1} z^{m-1}$ Thus  $g(T) = s(T) \Rightarrow f(T) = g(T) + b_{n+1}T^{n+1} = s(T) + b_{n+1}T^{n+1}$ . Apply the assumption to t defined by  $t(z) = z^n$ , getting  $\delta$  defined by  $\delta(z) = c_0' + c_1'z + \cdots + c_{m-1}'z^{m-1}$ . Thus  $t(T) = T^n = c_0' + c_1'z + \dots + c_{m-1}'z^{m-1} = \delta(T)$ . Hence  $\exists ! k_i \in \mathbb{F}, T^{n+1} = T(T^n) = k_0 + k_1 z + \dots + k_{m-1} z^{m-1}$ . And  $f(T) = s(T) + b_{n+1}(k_0 + k_1T + \dots + k_{m-1}T^{m-1})$  $\Rightarrow f(T) = (d_0 + k_0) + (d_1 + k_1)z + \dots + (d_{m-1} + k_{m-1})z^{m-1} = h(T)$ , thus defining h. 

• (4E 5.B.14) Suppose V is finite-dim,  $T \in \mathcal{L}(V)$  has mini poly p

defined by  $p(z) = a_0 + a_1 z + \dots + a_{m-1} z^{m-1} + z^m$ ,  $a_0 \neq 0$ . Find the mini poly of  $T^{-1}$ .

### **SOLUTION:**

Notice that *V* is finite-dim. Then  $p(0) = a_0 \neq 0 \Rightarrow 0$  is not a zero of  $p \Rightarrow T - 0I = T$  is inv.

Then  $p(T) = a_0 I + a_1 T + \dots + T^m = 0$ . Apply  $T^{-m}$  to both sides,

$$a_0(T^{-1})^m + a_1(T^{-1})^{m-1} + \dots + a_{m-1}T^{-1} + I = 0.$$

Define 
$$q$$
 by  $q(z) = z^m + \frac{a_1}{a_0} z^{m-1} + \dots + \frac{a_{m-1}}{a_0} z + \frac{1}{a_0}$  for all  $z \in \mathbf{F}$ .

We now show that  $(T^{-1})^k \notin \text{span}(I, T^{-1}, ..., (T^{-1})^{k-1})$ 

for every  $k \in \{1, ..., m-1\}$  by contradiction, so that q is exactly the mini poly of  $T^{-1}$ .

Suppose  $(T^{-1})^k \in \text{span}(I, T^{-1}, ..., (T^{-1})^{k-1}).$ 

Then let  $(T^{-1})^k = b_0 I + b_1 T^{-1} + \dots + b_{k-1} T^{k-1}$ . Apply  $T^k$  to both sides,

getting 
$$I = b_0 T^k + b_1 T^{k-1} + \dots + b_{k-1} T$$
, hence  $T^k \in \text{span}(I, T, \dots, T^{k-1})$ .

Thus f defined by  $f(z) = z^k + \frac{b_1}{b_0}z^{k-1} + \dots + \frac{b_{k-1}}{b_0}z - \frac{1}{b_0}$  is a poly multi of p.

While  $\deg f < \deg p$ . Contradicts.

If  $\theta = 2k\pi$ , then T = I and the mini poly is z - 1.

Now suppose (v, Tv) is linely inde. Then span  $(v, Tv) = \mathbb{R}^2$ .

Suppose the mini poly p is defined by  $p(z) = z^2 + bz + c$  for all  $z \in \mathbb{R}$ .

Because

$$L = |OD|$$

$$T^{2} \overrightarrow{v} = \overrightarrow{OA}$$

$$T \overrightarrow{v} = \overrightarrow{OC}$$

$$\overrightarrow{v} = \overrightarrow{OB}$$

$$\theta$$

$$\begin{array}{c|c}
L = |OD| \\
T^{2} \overrightarrow{v} = \overrightarrow{OA} \\
T \overrightarrow{v} = \overrightarrow{OC} \\
\overrightarrow{v} = \overrightarrow{OB} \\
O
\end{array}$$

$$\begin{array}{c|c}
Tv = \frac{|\overrightarrow{v}|}{2L}(T^{2}v + v) \Rightarrow T = \frac{|\overrightarrow{v}|}{2L}(T^{2} + I) \\
L = |\overrightarrow{v}|\cos\theta \Rightarrow \frac{|\overrightarrow{v}|}{2L} = \frac{1}{2\cos\theta}$$

Hence  $p(T) = T^2 - 2\cos\theta T + I = 0$  and  $z^2 - 2\cos\theta z + 1$  is the mini poly of T.

Or. By  $(4 \to 5.B.11)$ ,  $\mathcal{M}\left(T, (e_1, e_2)\right) = \begin{pmatrix} \cos\theta & \sin\theta \\ -\sin\theta & \cos\theta \end{pmatrix}$ . Hence the mini poly is  $z \pm 1$  or  $z^2 - 2\cos\theta z + 1.\Box$ 

- ullet (4E 5.B.11) Suppose V is a two-dim vecsp,  $T\in\mathcal{L}(V)$ , and the matrix of Twith resp to some basis of V is  $\begin{pmatrix} a & c \\ h & d \end{pmatrix}$ .
  - (a) Show that  $T^2 (a + d)T + (ad bc)I = 0$ .
  - (b) Show that the mini poly of T equals

$$\begin{cases} z - a & \text{if } b = c = 0 \text{ and } a = d, \\ z^2 - (a+d)z + (ad-bc) & \text{otherwise.} \end{cases}$$

SOLUTION: (a) Suppose the basis is (v, w). Because  $\begin{cases} Tv = av + bw \Rightarrow (T - aI)v = bw, \text{ then apply } (T - dI) \text{ to both sides.} \\ Tw = cv + dw \Rightarrow (T - dI)w = cv, \text{ then apply } (T - aI) \text{ to both sides.} \end{cases}$ 

Hence  $(T - aI)(T - dI) = bcI \Rightarrow T^2 - (a + d)T + (ad - bc)I = 0$ .

(b) If b = c = 0 and a = d. Then  $\mathcal{M}(T) = \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix} = a\mathcal{M}(I)$ . Thus T = aI. Hence the mini poly is z - a.

Otherwise, by (a),  $z^2 - (a + d)z + (ad - bc)$  is a poly multi of the mini poly.

Now we prove that  $T \notin \text{span}(I)$ , so that then the mini poly of T has exactly degree 2.

( At least one of the assumption of (I),(II) below is true. )

- (I) Suppose a = d, then  $Tv = av + bw \notin \text{span}(v)$ ,  $Tw = cv + aw \notin \text{span}(w)$ .

### **SOLUTION:**

We prove  $(TS)^m = S^{-1}(ST)^m S$  for each  $m \in \mathbb{N}$  by induction.

- (i) m = 0, 1.  $TS^0 = I = S^{-1}(ST)^0 S$ ;  $TS = S^{-1}(ST) S$ .
- (ii) m > 1. Assume that  $(TS)^m = S^{-1}(ST)^m S$ .

Then 
$$(TS)^{m+1} = (TS)^m (TS) = S^{-1} (ST)^m STS = S^{-1} (ST)^{m+1} S$$
.

Hence 
$$\forall p \in \mathcal{P}(\mathbf{F}), p(TS) = a_0(TS)^0 + a_1(TS) + \dots + a_m(TS)^m$$
  

$$= a_0[S^{-1}(ST)^0S] + a_1[S^{-1}(ST)S] + \dots + a_m[S^{-1}(ST)^mS]$$

$$= S^{-1}[a_0(ST)^0 + a_1(ST) + \dots + a_m(ST)^m]S$$

$$= S^{-1}p(ST)S.$$

### **SOLUTION:**

- (a) Define S by S(x,y) = (x,x). Define T by T(x,y) = (0,y). Then ST(x,y) = 0, TS(x,y) = (0,x) for all  $(x,y) \in \mathbb{F}^2$ . Thus  $ST = 0 \neq TS$  and  $(TS)^2 = 0$ .

Show that the mini poly of T is p defined by  $p(z) = a_0 + a_1 z + \cdots + a_{n-1} z^{n-1} + z^n$ .

 $\mathcal{M}(T)$  is called the **companion matrix** of the poly above. This exercise shows that every monic poly is the mini poly of some operator. Hence a formula or an algorithm that could produce exact eigvals for each operator on each  $\mathbf{F}^n$  could then produce exact zeros for each poly [ by 8.36(b) ]. - EIGENVALUES ON ODD-DIMENSIONAL REAL VECTOR SPACES
- Even-Dimensional Null Space

Suppose F = R, V is finite-dim,  $T \in \mathcal{L}(V)$  and  $b, c \in R$  with  $b^2 < 4c$ .

*Prove that* dim null  $(T^2 + bT + cI)$  *is an even number.* 

### **SOLUTION:**

Denote null  $(T^2 + bT + cI)$  by R. Then  $T|_R + bT|_R + cI_R = (T + bT + cI)|_R = 0 \in \mathcal{L}(R)$ .

Suppose  $\lambda$  is an eigval of  $T_R$  with an eigvec  $v \in R$ .

Then 
$$0 = (T|_R^2 + bT|_R + cI_R)(v) = (\lambda^2 + \lambda b + c)v = \left((\lambda + b)^2 + c - \frac{b^2}{4}\right)v$$
.  
Because  $c - \frac{b^2}{4} > 0$  and we have  $v = 0$ . Thus  $T_R$  has no eigvals.

Let *U* be an invar subsp of *R* that has the largest, even dim among all invar subsps.

Assume that  $U \neq R$ . Then  $\exists w \in R$  but  $w \notin U$ . Let W be such that  $(w, T|_R w)$  is a basis of W.

Because  $T|_R^2 w = -bT|_R w - cw \in W$ . Hence W is an invar subsp of dim 2.

Thus  $\dim(U + W) = \dim U + 2 - \dim(U \cap W)$ , where  $U \cap W = \{0\}$ ,

for if not, because  $w \notin U$ ,  $T|_R w \in U$ ,

 $U \cap W$  is invar under  $T|_R$  of one dim ( impossible because  $T|_R$  has no eigees ).

Hence U + W is even-dim invar subsp under  $T|_R$ , contradicting the maximality of dim U.

Thus the assumption was incorrect. Hence  $R = \text{null}(T^2 + bT + cI) = U$  has even dim.

Because deg  $q < \deg p$  and p is the mini poly of T, hence range  $(T^2 + bT + cI) \neq V$ .  $\mathbb{Z}$  dim V is odd and dim null  $(T^2 + bT + cI)$  is even (by our previous result). Thus dim V – dim null ( $T^2 + bT + cI$ ) = dim range ( $T^2 + bT + cI$ ) is odd. By [5.18], range  $(T^2 + bT + cI)$  is an invar subsp of V under T that has odd dim less than n. For this exercise,  $\mathcal{E}$  may contain any number of elements, and  $\mathcal{E}$  may even be an infinite set. **SOLUTION: 3** Suppose  $S, T \in \mathcal{L}(V)$  are such that ST = TS. Suppose  $p \in \mathcal{P}(\mathbf{F})$ . (a) Prove that null p(S) is invar under T. (b) Prove that range p(S) is invar under T. See Note For [5.17] for the special case S = T. **SOLUTION: 4** *Prove or give a counterexample:* A diag matrix A and an upper-trig matrix B of the same size commute. **SOLUTION: 5** *Prove that a pair of operators on a finite-dim vecsp commute*  $\iff$  *their dual operators commute.* 

**SOLUTION:**
